Aore than one NE in the stage game

101101121121

 Theorem

 Suppose that the stage game G has exactly one NE. [q_1^*, q_1^*,..., q_1^*]. Then for any f (0,1) and any T, the Times repeated game has a unique SPNE in which all players i play a_1^* at all information sets.

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

 • All pat payoffs are suck

•	The basic idea of the proof for this proposition is exactly the same that we saw in
	the repeated prisoner's dilemma All past payoffs are sunk
	In the last period, the incentives of all players are exactly the same as if the game were being played once
1	Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point
	· a · · · · · · · · · · · · · · · · · ·
۲	The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
	All past payoffs are sunk In the last period, the incentives of all players are exactly the same as if the game
	were being played once Thus all players must play the stage game Nash equilibrium action regardless of
•	the history of play up to that point But then we can induct

	The basic idea of the proof for this proposition is exactly the same that we saw in
	The basic deal of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma All past payoffs are sunk
	In the last period, the incentives of all players are exactly the same as if the game were being played once
•	Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point
	But then we can induct Knowing that the stage game Nash equilibrium is going to be played tomorrow, at
	any information set, we can ignore the past payoffs
	101107121121 2 040
۲	The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
	All past payoffs are sunk In the last period, the incentives of all players are exactly the same as if the game
	were being played once Thus all players must play the stage game Nash equilibrium action regardless of
	the history of play up to that point But then we can induct
	Knowing that the stage game Nash equilibrium is going to be played tomorrow, at any information set, we can ignore the past payoffs
	We concentrate just on the payoffs in the future. Thus in period $T - 1$, player <i>i</i> simply wants to maximize:
	$\max_{\mathbf{a}_i \in A_i} \delta^{T-2} v_i(a_i, a_{-i}^{T-1}) + \delta^{T-1} v_i(\mathbf{a}^*).$
	What player i plays today has no consequences for what happens in period ${\cal T}$
	since we saw that all players will play a^{\ast} no matter what happens in period $\mathcal{T}-1$
	101(10)(2)(2)(2)
	What player i plays today has no consequences for what happens in period ${\cal T}$
	since we saw that all players will play a* no matter what happens in period ${\cal T}-1$
•	So, the maximization problem above is the same as: $\max_{a \in A} u_i(a_i, a_{-i}^{T-1}).$
	$\psi \in \Psi$ where α^{-1} is
	· · · · Ø · · 3 · · 3 · 3 · 040
۲	What player i plays today has no consequences for what happens in period T since we saw that all players will play a' no matter what happens in period $T-1$
2	
•	So, the maximization problem above is the same as:
	So, the maximization problem above is the same as: $\max_{a_i \in A_i} u_i(a_i, a_{-i}^{T-1}).$
	$\max_{a_i \in A_i} w_i(a_i, a_{-i}^{T-1}).$
	$\max_{a_i\in A}a_i(a_i,a_T^{-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_t^{T-1}=a_1^*,\ldots,a_n^{T-1}=a_n^*.$
	$\max_{a_i \in A_i} w_i(a_i, a_{-i}^{T-1}).$
•	$\max_{a \in A_i} u(a, a_{-1}^{T-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_1^{T-1} = a_1^*, \dots, a_n^{T-1} = a_n^*$.
•	$\max_{a_i\in A}a_i(a_i,a_T^{-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_t^{T-1}=a_1^*,\ldots,a_n^{T-1}=a_n^*.$
•	$\max_{a,c,b_i} w_i(a_i, a_i^{T-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_i^{T-1} = a_1^*, \dots, a_d^{T-1} = a_d^*$. What player <i>i</i> plays today has no consequences for what happens in period <i>T</i> since we saw that all players will play a" no matter what happens in period <i>T</i> - 1 So, the maximization problem above is the same as:
•	$\max_{a_i \in A_i} (a_i, a_{i-1}^{T-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_i^{T-1} = a_i^*, \ldots, a_n^{T-1} = a_n^*$. What player <i>i</i> plays today has no consequences for what happens in period <i>T</i> and <i>T</i>
•	$\max_{a,c,b_i} w_i(a_i, a_i^{T-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_i^{T-1} = a_1^*, \dots, a_d^{T-1} = a_d^*$. What player <i>i</i> plays today has no consequences for what happens in period <i>T</i> since we saw that all players will play a" no matter what happens in period <i>T</i> - 1 So, the maximization problem above is the same as:
*	$\max_{s \in A_i} u(s, s_{-1}^{T-1}).$ Thus again, for this to be a Nash equilibrium, we need $a_1^{T-1} = a_1^*, \ldots, a_n^{T-1} = a_n^*$. What player <i>i</i> plays today has no consequences for what happens in period <i>T</i> and <i>T</i> are we saw that all players will play a no matter what happens in period <i>T</i> and <i>T</i> and <i>T</i> and <i>T</i> and <i>T</i> and <i>T</i> are the maximization problem above is the same as: $\max_{s \in A_n} u(s_1, s_{-1}^{T-1}).$

101101121121 2 1

Proof

To see this, suppose that a history (a₁, a₂) was played in period 1 resulting in payoffs from period 1 of (x, y)

Proof

- \blacktriangleright To see this, suppose that a history (a_1,a_2) was played in period 1 resulting in payoffs from period 1 of (x,y)
- Then the normal form of the subgame starting in period 2 is given by: Normal Form

 Normal Form

 A2
 B2
 C2

 A1
 $(x, y) + \delta(1, 1)$ $(x, y) + \delta(0, 0)$ $(x, y) + \delta(0, 0)$

 B1
 $(x, y) + \delta(0, 0)$ $(x, y) + \delta(4, 4)$ $(x, y) + \delta(1, 5)$

 C1
 $(x, y) + \delta(0, 0)$ $(x, y) + \delta(5, 1)$ $(x, y) + \delta(3, 3)$

Proof

 \blacktriangleright Since we are just adding the same (x,y) to each cell and multiplying by $\delta,$ the Nash equilibrium remains unchanged from the original stage game

Since we are just adding the same (x, y) to each cell and multiplying by δ , the Nash equilibrium remains uncharged from the original stage game	
▶ The set of Nash equilibria of this subgame is given by (A_1, A_2) and (C_1, C_2)	
101-17-13-13-040 Proof	
 Since we are just adding the same (x, y) to each cell and multiplying by 8, the Nash equilibrium remains unchanged from the original stage game The set of Nash equilibria of this subgame is given by (A1, A2) and (C1, C2) 	
 Thus after any history, the set of pure strategy NE are (A₁, A₂) or (C₁, C₂) 	
Proof	
 ► Since we are just adding the same (x, y) to each cell and multiplying by ñ, the Nash equilibrium remains unchanged from the original stage game ► The set of Nash equilibria of this subgame is given by (A₁, A₂) and (C₁, C₂) 	
 ► Thus after any history, the set of pure strategy NE are (A₁, A₂) or (C₁, C₂) ► Since SPNE requires Nash equilibrium in every subgame, this means that after any history, (A₁, A₂) or (C₁, C₂) must be played

The subgame is just the original game with a payoff of (4, 4) adds and multiplying by δ	ed to each box

- If we add the same utility to all boxes, then the preferences of players are completely unchanged
- Therefore the set of Nash equilibria are the same in this subgame as in the stage game

- \blacktriangleright The subgame is just the original game with a payoff of (4, 4) added to each box and multiplying by δ
- If we add the same utility to all boxes, then the preferences of players are completely unchanged
- Therefore the set of Nash equilibria are the same in this subgame as in the stage game
- ► So it is a Nash equilibrium in this subgame for players to play (A₁, A₂), which is consistent with the strategy that we proposed

▶ Let us now check that after observing $(\alpha_1, \alpha_2) \neq (B_1, B_2)$, then it is a Nash equilibrium in the subgame for players to play (C_1, C_2)

Let us now check that after observing $(\alpha_1, \alpha_2) \neq (B_1, B_2)$, then it is a Nash equilibrium in the subgame for players to play (C_1, C_2)

▶ If $(\alpha_1, \alpha_2) \neq (B_1, B_2)$ is observed there are some payoffs (x, y) such that the subgame induces the following normal form Normal Form

 \blacktriangleright Again in this case, note that we are simply adding the same payoff profile (x,y) to every box and multiplying by δ

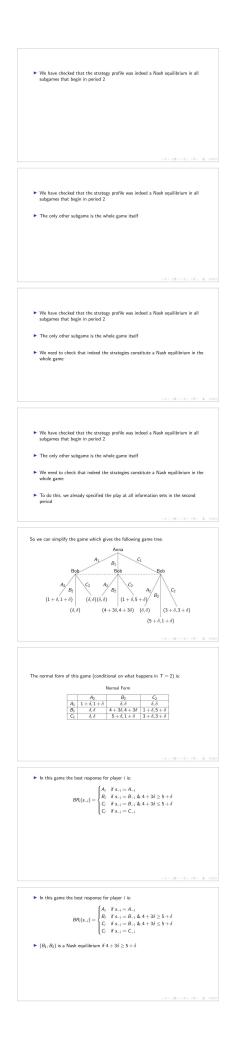

· · · · Ø · · 2 · · 3 · 2 · 00

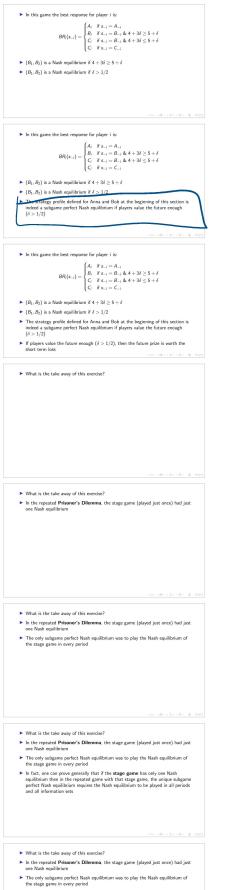

- $\blacktriangleright\,$ Again in this case, note that we are simply adding the same payoff profile (x,y) to every box and multiplying by δ
- Therefore, the Nash equilibrium is again the set of Nash equilibrium of the original stage game

10110-101121121 2 000

- $\blacktriangleright\,$ Again in this case, note that we are simply adding the same payoff profile (x,y) to every box and multiplying by δ
- Therefore, the Nash equilibrium is again the set of Nash equilibrium of the original stage game
- \blacktriangleright In this subgame, it is a Nash equilibrium for players to play $(\mathcal{A}_1,\mathcal{A}_2)$

(BIBE) ENTEL ES EPS SI S>1/2

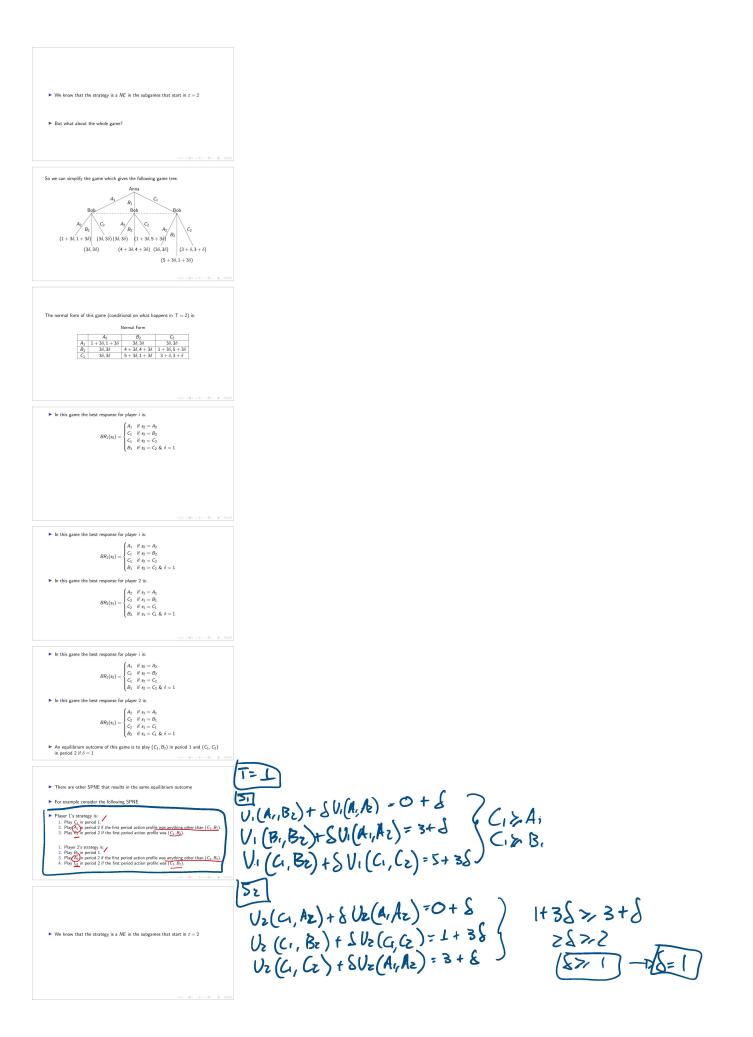

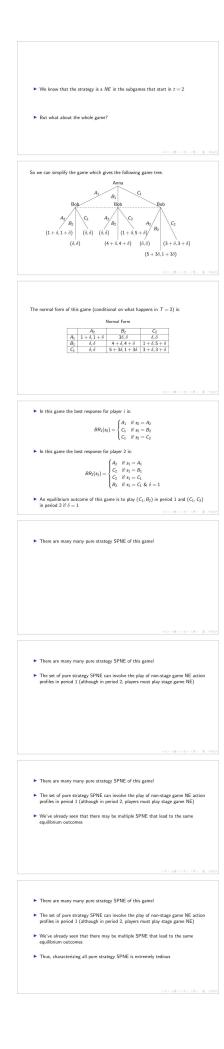

- one insol equivariant The only subgence perfect. Nash equilibrium was to play the Nash equilibrium of the stage game in every period In fact, one can prove generally that if the stage game has only one Nash equilibrium then in the repeated game with that stage game, the unique subgame perfect fash equilabrium requires the Nash equilibrium to be played in all periods and all information sets
- In contrast, in this game, we saw that there was a subgame perfect Nash equilibrium in which an action profile (B₁, B₂) that was **not** a Nash equilibrium of the stage game was played in period 1

 What is the take away of this exercise? In the repeated Prisoner's Dilemma, the stage game (played just once) had just ones have equilibrium of the stage game in every period. In fact, one can prove generally that if the stage game has only one Nash equilibrium then in the repeated game with that stage game, the unique subgame perfect Nash equilibrium to regulate that stage game. A share equilibrium of all information sets and all information sets and all information sets that the stage game has not a Nash equilibrium of the stage game, the unique subgame perfect Nash equilibrium in the repeated game with that stage game. A share equilibrium of the stage game with a stage game is the stage game with stage in period 1. In contast, in this game, we saw that there was a subgame perfect Nash equilibrium of the stage game was begade in period 1. This was because there were multing Nash was not a Nash equilibrium of the stage game was begade in period 1. This was because there were multing Nash was not a Nash equilibrium of the stage game share between the stage game. The stage stage is the stage game was been perfect Nash equilibrium of the stage game share between the stage game. The stage stage stage stage stage stage is the stage game was been stage stage stage stage stage stage game. The stage stage
• Are there any other action profiles that can be played in the first period? $Norma Form$ $\boxed{\frac{A_2}{0} + \frac{B_2}{0} + \frac{B_3}{0} - \frac{A_3}{0} + \frac{B_3}{0} - \frac{B_3}$
 Are there any other action profiles that can be played in the first period? <u>Normal Form</u> <u>Normal Form</u> <u>Normal Form</u> <u>Normal Form</u> Suppose that the players were to play (A₁, B₂) in the first period Can this occur? The answer is no
 Are there any other action profiles that can be played in the first period? Normal Form Are 1 by 1 coordinate to a second the played of the played of the players were to play (A₁, B₂) in the first period. Suppose that the players were to play (A₂, B₂) in the first period. Can this occur? The answer is no Remember either (A₁, A₂) or (C₁, C₂) must be played in any pure strategy SPNE after a history.
Now let us argue that (A ₁ , B ₂) cannot be played in period 1 in a SPNE
Now let us argue that (A ₁ , B ₂) cannot be played in period 1 in a SPNE Suppose otherwise
 Now let us argue that (A₁, B₂) cannot be played in period 1 in a SPNE Suppose otherwise No matter what happens in the second period, there is no way A₁ could be a best response against B₂ in the first period.

▶ Now let us argue that (A_1, B_2) cannot be played in period 1 in a SPNE	
Suppose otherwise	
No matter what happens in the second period, there is no way A ₁ could be a best response against B ₂ in the first period.	
The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:
