More than one NE in the stage game

Example 1

Example 2

Theorem

Suppose that the stage game  $G$  has exactly one NE  $(s_1^*, s_2^*, \dots, s_n^*)$ . Then for any  $\delta \in (0, 1]$  and any  $T$ , the  $T$ -time repeated game has a unique SPNE in which all players  $i$  play  $s_i^*$  at all information sets.

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk
- ▶ In the last period, the incentives of all players are exactly the same as if the game were being played once

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk
- ▶ In the last period, the incentives of all players are exactly the same as if the game were being played once
- ▶ Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk
- ▶ In the last period, the incentives of all players are exactly the same as if the game were being played once
- ▶ Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point
- ▶ But then we can induct

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk
- ▶ In the last period, the incentives of all players are exactly the same as if the game were being played once
- ▶ Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point
- ▶ But then we can induct
- ▶ Knowing that the stage game Nash equilibrium is going to be played tomorrow, at any information set, we can ignore the past payoffs

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ The basic idea of the proof for this proposition is exactly the same that we saw in the repeated prisoner's dilemma
- ▶ All past payoffs are sunk
- ▶ In the last period, the incentives of all players are exactly the same as if the game were being played once
- ▶ Thus all players must play the stage game Nash equilibrium action regardless of the history of play up to that point
- ▶ But then we can induct
- ▶ Knowing that the stage game Nash equilibrium is going to be played tomorrow, at any information set, we can ignore the past payoffs
- ▶ We concentrate just on the payoffs in the future. Thus in period  $T - 1$ , player  $i$  simply wants to maximize:

$$\max_{a_i^T} \delta^{T-1} u_i(a_i^T, a_{-i}^{T-1}) + \delta^{T-1} u_i(a_i^T)$$

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ What player  $i$  plays today has no consequences for what happens in period  $T$  since we saw that all players will play  $a^*$  no matter what happens in period  $T - 1$

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ What player  $i$  plays today has no consequences for what happens in period  $T$  since we saw that all players will play  $a^*$  no matter what happens in period  $T - 1$

- ▶ So, the maximization problem above is the same as:

$$\max_{a_i^T} u_i(a_i^T, a_{-i}^{T-1})$$

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ What player  $i$  plays today has no consequences for what happens in period  $T$  since we saw that all players will play  $a^*$  no matter what happens in period  $T - 1$

- ▶ So, the maximization problem above is the same as:

$$\max_{a_i^T} u_i(a_i^T, a_{-i}^{T-1})$$

- ▶ Thus again, for this to be a Nash equilibrium, we need  $a_1^{T-1} = a_1^*, \dots, a_n^{T-1} = a_n^*$

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ What player  $i$  plays today has no consequences for what happens in period  $T$  since we saw that all players will play  $a^*$  no matter what happens in period  $T - 1$

- ▶ So, the maximization problem above is the same as:

$$\max_{a_i^T} u_i(a_i^T, a_{-i}^{T-1})$$

- ▶ Thus again, for this to be a Nash equilibrium, we need  $a_1^{T-1} = a_1^*, \dots, a_n^{T-1} = a_n^*$

- ▶ Following exactly this induction, we can conclude that every player must play  $a_i^*$  at all times and all histories

## Lecture 18: Repeated Games

Recap from last class

More than one NE in the stage game

Example 1

Example 2

18.1 | 18.1 | 18.1 | 18.1 | 18.1

- ▶ What would happen if there are more than one NE of the stage game?

18.1 | 18.1 | 18.1 | 18.1 | 18.1

► What would happen if there are more than one NE of the stage game?

► Suppose instead that the stage game looks as follows:

Normal Form (G)

	A <sub>2</sub>	B <sub>2</sub>	C <sub>2</sub>
A <sub>1</sub>	0,0	0,0	0,0
B <sub>1</sub>	0,0	1,1	1,1
C <sub>1</sub>	0,0	1,1	1,1

NE = (A<sub>1</sub>, A<sub>2</sub>), (C<sub>1</sub>, C<sub>2</sub>)  
 Pareto Dominant: (B<sub>1</sub>, B<sub>2</sub>)

► If the game is only played once

► If the game is only played once

► There are two pure strategy Nash equilibria: (A<sub>1</sub>, A<sub>2</sub>) and (C<sub>1</sub>, C<sub>2</sub>).

► If the game is only played once

► There are two pure strategy Nash equilibria: (A<sub>1</sub>, A<sub>2</sub>) and (C<sub>1</sub>, C<sub>2</sub>).

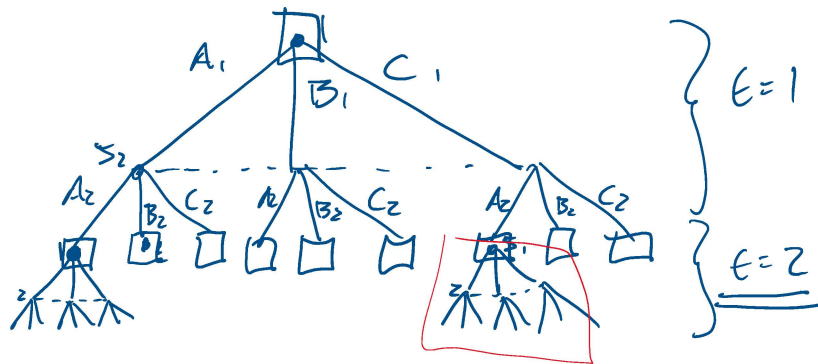

► (B<sub>1</sub>, B<sub>2</sub>) is not a Nash equilibrium if the game is only played once

► If the game is only played once

► There are two pure strategy Nash equilibria: (A<sub>1</sub>, A<sub>2</sub>) and (C<sub>1</sub>, C<sub>2</sub>).

► (B<sub>1</sub>, B<sub>2</sub>) is not a Nash equilibrium if the game is only played once

► In the one-shot game, the Nash equilibria are inefficient because they are Pareto dominated by (B<sub>1</sub>, B<sub>2</sub>)

$T=2$   
 $3 \times 3 \times 3 \dots \dots \dots \times^2 = 3^{10} = 59,049$   
 Contingencies  
 $E=1$        $E=2$

► Playing the NE of the stage game in every period is a SPNE in the repeated game

► Playing the NE of the stage game in every period is a SPNE in the repeated game

► The logic is the same as when there is a single NE

► Always playing (A<sub>1</sub>, A<sub>2</sub>) is a SPNE

► Always playing (A<sub>1</sub>, A<sub>2</sub>) is a SPNE

► Player 1's strategy is given by:  
 1. Play A<sub>1</sub> in period 1;  
 2. Play A<sub>1</sub> at all histories in period 2.

► Player 2's strategy is given by:  
 1. Play A<sub>2</sub> in period 1;  
 2. Play A<sub>2</sub> at all histories in period 2.

▶ Always playing  $(C_1, C_2)$  is a SPNE

1 2 3 4 5 6 7 8 9 10 11 12

▶ Always playing  $(C_1, C_2)$  is a SPNE

▶ Player 1's strategy is given by:  
1. Play  $C_1$  in period 1;  
2. Play  $C_1$  at all histories in period 2.

▶ Player 2's strategy is given by:  
1. Play  $C_2$  in period 1;  
2. Play  $C_2$  at all histories in period 2.

1 2 3 4 5 6 7 8 9 10 11 12

But are there more?

1 2 3 4 5 6 7 8 9 10 11 12

▶ Combining *NE* of the stage game is also a SPNE

1 2 3 4 5 6 7 8 9 10 11 12

▶ Combining *NE* of the stage game is also a SPNE

▶ The logic is the same as before

1 2 3 4 5 6 7 8 9 10 11 12

▶ Playing  $(A_1, A_2)$  in  $t = 1$  and  $(C_1, C_2)$  in  $t = 2$  is a SPNE

1 2 3 4 5 6 7 8 9 10 11 12

▶ Playing  $(A_1, A_2)$  in  $t = 1$  and  $(C_1, C_2)$  in  $t = 2$  is a SPNE

▶ Player 1's strategy is given by:  
1. Play  $A_1$  in period 1;  
2. Play  $C_1$  at all histories in period 2.

▶ Player 2's strategy is given by:  
1. Play  $A_2$  in period 1;  
2. Play  $C_2$  at all histories in period 2.

1 2 3 4 5 6 7 8 9 10 11 12

▶ Similarly, playing  $(C_1, C_2)$  in  $t = 1$  and  $(A_1, A_2)$  in  $t = 2$  is a SPNE

1 2 3 4 5 6 7 8 9 10 11 12

▶ Similarly, playing  $(C_1, C_2)$  in  $t = 1$  and  $(A_1, A_2)$  in  $t = 2$  is a SPNE

▶ Player 1's strategy is given by:  
1. Play  $C_1$  in period 1;  
2. Play  $A_1$  at all histories in period 2.

▶ Player 2's strategy is given by:  
1. Play  $C_2$  in period 1;  
2. Play  $A_2$  at all histories in period 2.

1 2 3 4 5 6 7 8 9 10 11 12

► This is uninteresting since Nash equilibria are played in every period

► This is uninteresting since Nash equilibria are played in every period  
► But are there more?

► This is uninteresting since Nash equilibria are played in every period  
► But are there more?  
► The SPNE that we've considered, players always play strategies that do not condition on what happened in the **past**

► This is uninteresting since Nash equilibria are played in every period  
► But are there more?  
► The SPNE that we've considered, players always play strategies that do not condition on what happened in the **past**  
► What makes a repeated game interesting is when players play strategies in SPNE that condition on what happened in the past

► This is uninteresting since Nash equilibria are played in every period  
► But are there more?  
► The SPNE that we've considered, players always play strategies that do not condition on what happened in the **past**  
► What makes a repeated game interesting is when players play strategies in SPNE that condition on what happened in the past  
► This could not happen when the stage game had a unique NE

► This is uninteresting since Nash equilibria are played in every period  
► But are there more?  
► The SPNE that we've considered, players always play strategies that do not condition on what happened in the **past**  
► What makes a repeated game interesting is when players play strategies in SPNE that condition on what happened in the past  
► This could not happen when the stage game had a unique NE  
► In the last period, all players were required to play the unique NE action after all histories!

Proof

► To see this, suppose that a history  $(x_1, x_2)$  was played in period 1 resulting in payoffs from period 1 of  $(x, y)$

Proof

- ▶ To see this, suppose that a history  $(a_1, a_2)$  was played in period 1 resulting in payoffs from period 1 of  $(x, y)$
- ▶ Then the normal form of the subgame starting in period 2 is given by:

		$A_2$	$B_2$	$C_2$
$A_1$	$(x, y) + \delta(1, 1)$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(0, 0)$	
$B_1$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(4, 4)$	$(x, y) + \delta(5, 5)$	
$C_1$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(5, 1)$	$(x, y) + \delta(3, 3)$	

11.01.18 | 10.1 | 18.1 | 8 | 20/20

Proof

- ▶ Since we are just adding the same  $(x, y)$  to each cell and multiplying by  $\delta$ , the Nash equilibrium remains unchanged from the original stage game

11.01.18 | 10.1 | 18.1 | 8 | 20/20

Proof

- ▶ Since we are just adding the same  $(x, y)$  to each cell and multiplying by  $\delta$ , the Nash equilibrium remains unchanged from the original stage game
- ▶ The set of Nash equilibria of this subgame is given by  $(A_1, A_2)$  and  $(C_1, C_2)$

11.01.18 | 10.1 | 18.1 | 8 | 20/20

Proof

- ▶ Since we are just adding the same  $(x, y)$  to each cell and multiplying by  $\delta$ , the Nash equilibrium remains unchanged from the original stage game
- ▶ The set of Nash equilibria of this subgame is given by  $(A_1, A_2)$  and  $(C_1, C_2)$
- ▶ Thus after any history, the set of pure strategy NE are  $(A_1, A_2)$  or  $(C_1, C_2)$

11.01.18 | 10.1 | 18.1 | 8 | 20/20

Proof

- ▶ Since we are just adding the same  $(x, y)$  to each cell and multiplying by  $\delta$ , the Nash equilibrium remains unchanged from the original stage game
- ▶ The set of Nash equilibria of this subgame is given by  $(A_1, A_2)$  and  $(C_1, C_2)$
- ▶ Thus after any history, the set of pure strategy NE are  $(A_1, A_2)$  or  $(C_1, C_2)$
- ▶ Since SPNE requires Nash equilibrium in every subgame, this means that after any history,  $(A_1, A_2)$  or  $(C_1, C_2)$  must be played

11.01.18 | 10.1 | 18.1 | 8 | 20/20

- ▶ Lets try to find a SPNE in which  $(B_1, B_2)$  is played in the first period.

		$A_2$	$B_2$	$C_2$
$A_1$	1, 1	0, 0	0, 0	
$B_1$	0, 0	4, 4	5, 5	
$C_1$	0, 0	5, 1	3, 3	

KASTIGO!

PUNTO!

11.01.18 | 10.1 | 18.1 | 8 | 20/20

- ▶ Consider the following strategy profile, where we punish in  $t = 2$  if we don't play  $(B_1, B_2)$  in  $t = 1$

11.01.18 | 10.1 | 18.1 | 8 | 20/20

- ▶ Consider the following strategy profile, where we punish in  $t = 2$  if we don't play  $(B_1, B_2)$  in  $t = 1$
- ▶ Anna plays the following strategy:

11.01.18 | 10.1 | 18.1 | 8 | 20/20

- ▶ Consider the following strategy profile, where we punish in  $t = 2$  if we don't play  $(B_1, B_2)$  in  $t = 1$
- ▶ Anna plays the following strategy:
  - Play  $B_1$  in period 1.

11.01.18 | 10.1 | 18.1 | 8 | 20/20

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Bob plays a similar strategy:

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Bob plays a similar strategy:

1. Play  $B_2$  in period 1.

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Bob plays a similar strategy:

1. Play  $B_2$  in period 1.
2. Play  $A_2$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.

► Consider the following strategy profile, where we punish in  $t=2$  if we don't play  $(B_1, B_2)$  in  $t=1$

► Anna plays the following strategy:

1. Play  $B_1$  in period 1.
2. Play  $A_1$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_1$  in period 2 if  $(B_1, B_2)$  is played in period 1.

► Bob plays a similar strategy:

1. Play  $B_2$  in period 1.
2. Play  $A_2$  in period 2 if anything other than  $(B_1, B_2)$  is played in period 1.
3. Play  $C_2$  in period 2 if  $(B_1, B_2)$  is played in period 1.

►  $\Delta \text{EPS} > 0 \quad \epsilon \text{ or } \epsilon = 2 \quad \checkmark$

$T=1$

$$\frac{1}{51} U_1(B_1, B_2) + \delta U_1(A_1, A_2) \geq U_1(C_1, B_2) + \delta U_1(A_1, A_2) = 5 + \delta$$

$$4 + 3\delta \geq 5 + \delta$$

$$2\delta \geq 1$$

$$\delta \geq 1/2$$

$S_2$  (SHOOTING)

If  $(B_1, B_2)$  is observed in the first period, the subgame corresponding to that observation admits the following normal form:

		Normal Form		
		$A_2$	$B_2$	$C_2$
$A_1$	$(4, 4) + \delta(1, 1)$	$(4, 4) + \delta(0, 0)$	$(4, 4) + \delta(0, 0)$	
$B_1$	$(4, 4) + \delta(0, 0)$	$(4, 4) + \delta(4, 4)$	$(4, 4) + \delta(1, 5)$	
$C_1$	$(4, 4) + \delta(0, 0)$	$(4, 4) + \delta(5, 1)$	$(4, 4) + \delta(3, 3)$	

► The subgame is just the original game with a payoff of  $(4, 4)$  added to each box and multiplying by  $\delta$

► The subgame is just the original game with a payoff of  $(4, 4)$  added to each box and multiplying by  $\delta$

► If we add the same utility to all boxes, then the preferences of players are completely unchanged

- ▶ The subgame is just the original game with a payoff of (4,4) added to each box and multiplying by  $\delta$
- ▶ If we add the same utility to all boxes, then the preferences of players are completely unchanged
- ▶ Therefore the set of Nash equilibria are the same in this subgame as in the stage game

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ The subgame is just the original game with a payoff of (4,4) added to each box and multiplying by  $\delta$
- ▶ If we add the same utility to all boxes, then the preferences of players are completely unchanged
- ▶ Therefore the set of Nash equilibria are the same in this subgame as in the stage game
- ▶ So it is a Nash equilibrium in this subgame for players to play  $(A_1, A_2)$ , which is consistent with the strategy that we proposed

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ Let us now check that after observing  $(s_{11}, s_{12}) \neq (B_1, B_2)$ , then it is a Nash equilibrium in the subgame for players to play  $(C_1, C_2)$

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ Let us now check that after observing  $(s_{11}, s_{12}) \neq (B_1, B_2)$ , then it is a Nash equilibrium in the subgame for players to play  $(C_1, C_2)$

- ▶ If  $(s_{11}, s_{12}) \neq (B_1, B_2)$  is observed there are some payoffs  $(x, y)$  such that the subgame induces the following normal form

Normal Form

	$A_2$	$B_2$	$C_2$
$A_1$	$(x, y) + \delta(1, 1)$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(0, 0)$
$B_1$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(4, 4)$	$(x, y) + \delta(1, 5)$
$C_1$	$(x, y) + \delta(0, 0)$	$(x, y) + \delta(5, 1)$	$(x, y) + \delta(3, 3)$

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ Again in this case, note that we are simply adding the same payoff profile  $(x, y)$  to every box and multiplying by  $\delta$

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ Again in this case, note that we are simply adding the same payoff profile  $(x, y)$  to every box and multiplying by  $\delta$

- ▶ Therefore, the Nash equilibrium is again the set of Nash equilibrium of the original stage game

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ Again in this case, note that we are simply adding the same payoff profile  $(x, y)$  to every box and multiplying by  $\delta$

- ▶ Therefore, the Nash equilibrium is again the set of Nash equilibrium of the original stage game

- ▶ In this subgame, it is a Nash equilibrium for players to play  $(A_1, A_2)$

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ We have checked that the strategy profile was indeed a Nash equilibrium in all subgames that begin in period 2

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- ▶ We have checked that the strategy profile was indeed a Nash equilibrium in all subgames that begin in period 2

- ▶ The only other subgame is the whole game itself

1.10.1 | 1.10.2 | 1.10.3 | 1.10.4 | 1.10.5

- We have checked that the strategy profile was indeed a Nash equilibrium in all subgames that begin in period 2
- The only other subgame is the whole game itself
- We need to check that indeed the strategies constitute a Nash equilibrium in the whole game

11.01.18 (19:13:18) 8 / 20/20

- We have checked that the strategy profile was indeed a Nash equilibrium in all subgames that begin in period 2
- The only other subgame is the whole game itself
- We need to check that indeed the strategies constitute a Nash equilibrium in the whole game
- To do this, we already specified the play at all information sets in the second period

11.01.18 (19:13:18) 8 / 20/20

So we can simplify the game which gives the following game tree.

11.01.18 (19:13:18) 8 / 20/20

The normal form of this game (conditional on what happens in  $T=2$ ) is:

Normal Form		
	$A_2$	$B_2$
$A_1$	$1 + \delta, 1 + \delta$	$\delta, \delta$
$B_1$	$\delta, \delta$	$4 + 3\delta, 4 + 3\delta$
$C_1$	$\delta, \delta$	$1 + \delta, 5 + \delta$

11.01.18 (19:13:18) 8 / 20/20

- In this game the best response for player  $i$  is:

$$BR(i, s_{-i}) = \begin{cases} A_i & \text{if } s_{-i} = A_{-i} \\ B_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \geq 5 + \delta \\ C_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \leq 5 + \delta \\ C_i & \text{if } s_{-i} = C_{-i} \end{cases}$$

11.01.18 (19:13:18) 8 / 20/20

- In this game the best response for player  $i$  is:

$$BR(i, s_{-i}) = \begin{cases} A_i & \text{if } s_{-i} = A_{-i} \\ B_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \geq 5 + \delta \\ C_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \leq 5 + \delta \\ C_i & \text{if } s_{-i} = C_{-i} \end{cases}$$

- $(B_1, B_2)$  is a Nash equilibrium if  $4 + 3\delta \geq 5 + \delta$

11.01.18 (19:13:18) 8 / 20/20

- In this game the best response for player  $i$  is:

$$BR(i, s_{-i}) = \begin{cases} A_i & \text{if } s_{-i} = A_{-i} \\ B_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \geq 5 + \delta \\ C_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \leq 5 + \delta \\ C_i & \text{if } s_{-i} = C_{-i} \end{cases}$$

- $(B_1, B_2)$  is a Nash equilibrium if  $4 + 3\delta \geq 5 + \delta$
- $(B_1, B_2)$  is a Nash equilibrium if  $\delta > 1/2$

11.01.18 (19:13:18) 8 / 20/20

- In this game the best response for player  $i$  is:

$$BR(i, s_{-i}) = \begin{cases} A_i & \text{if } s_{-i} = A_{-i} \\ B_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \geq 5 + \delta \\ C_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \leq 5 + \delta \\ C_i & \text{if } s_{-i} = C_{-i} \end{cases}$$

- $(B_1, B_2)$  is a Nash equilibrium if  $4 + 3\delta \geq 5 + \delta$
- $(B_1, B_2)$  is a Nash equilibrium if  $\delta > 1/2$

- The strategy profile defined for Anna and Bob at the beginning of this section is indeed a subgame perfect Nash equilibrium if players value the future enough ( $\delta > 1/2$ )

11.01.18 (19:13:18) 8 / 20/20

- In this game the best response for player  $i$  is:

$$BR(i, s_{-i}) = \begin{cases} A_i & \text{if } s_{-i} = A_{-i} \\ B_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \geq 5 + \delta \\ C_i & \text{if } s_{-i} = B_{-i} \text{ \& } 4 + 3\delta \leq 5 + \delta \\ C_i & \text{if } s_{-i} = C_{-i} \end{cases}$$

- $(B_1, B_2)$  is a Nash equilibrium if  $4 + 3\delta \geq 5 + \delta$
- $(B_1, B_2)$  is a Nash equilibrium if  $\delta > 1/2$

- The strategy profile defined for Anna and Bob at the beginning of this section is indeed a subgame perfect Nash equilibrium if players value the future enough ( $\delta > 1/2$ )
- If players value the future enough ( $\delta > 1/2$ ), then the future prize is worth the short term loss

11.01.18 (19:13:18) 8 / 20/20

What is the value of  $\alpha$  given?

What is the value of  $\alpha$  given?

In the repeated Prisoner's Dilemma, the expected payoff for each player has an equilibrium.

What is the value of  $\alpha$  given?

In the repeated Prisoner's Dilemma, the expected payoff for each player has an equilibrium.

The only strategy profile that is a Nash equilibrium of the repeated game is:

What is the value of  $\alpha$  given?

In the repeated Prisoner's Dilemma, the expected payoff for each player has an equilibrium.

The only strategy profile that is a Nash equilibrium of the repeated game is:

In the repeated game, if the players agree to cooperate, the expected payoff for each player is  $\alpha$ . If they do not cooperate, the expected payoff for each player is  $\beta$ .

What is the value of  $\alpha$  given?

In the repeated Prisoner's Dilemma, the expected payoff for each player has an equilibrium.

The only strategy profile that is a Nash equilibrium of the repeated game is:

In the repeated game, if the players agree to cooperate, the expected payoff for each player is  $\alpha$ . If they do not cooperate, the expected payoff for each player is  $\beta$ .

In the repeated game, if the players agree to cooperate, the expected payoff for each player is  $\alpha$ . If they do not cooperate, the expected payoff for each player is  $\beta$ .

What is the value of  $\alpha$  given?

In the repeated Prisoner's Dilemma, the expected payoff for each player has an equilibrium.

The only strategy profile that is a Nash equilibrium of the repeated game is:

In the repeated game, if the players agree to cooperate, the expected payoff for each player is  $\alpha$ . If they do not cooperate, the expected payoff for each player is  $\beta$ .

In the repeated game, if the players agree to cooperate, the expected payoff for each player is  $\alpha$ . If they do not cooperate, the expected payoff for each player is  $\beta$ .

The only strategy profile that is a Nash equilibrium of the repeated game is:

Are there any other strategy profiles that are Nash equilibria in this game?

Yes, there are.

	C	D
A	1, 1	0, 2
B	0, 2	1, 1

Are there any other strategy profiles that are Nash equilibria in this game?

Yes, there are.

	C	D
A	1, 1	0, 2
B	0, 2	1, 1

Are there any other strategy profiles that are Nash equilibria in this game?

Yes, there are.

	C	D
A	1, 1	0, 2
B	0, 2	1, 1

Are there any other strategy profiles that are Nash equilibria in this game?

Yes, there are.

	C	D
A	1, 1	0, 2
B	0, 2	1, 1

Are there any other strategy profiles that are Nash equilibria in this game?

No, there are not.

- Are there any other action profiles that can be played in the first period?

Normal Form

	$A_2$	$B_2$	$C_2$
$A_1$	1, 1	0, 0	0, 0
$B_1$	0, 0	4, 4	1, 5
$C_1$	0, 0	5, 1	3, 3

- Suppose that the players were to play  $(A_1, B_2)$  in the first period
- Can this occur? The answer is **no**
- Remember either  $(A_1, A_2)$  or  $(C_1, C_2)$  must be played in any pure strategy SPNE after a history

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.
- The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:

$$u_1(A_1, B_2) + \delta u_1(C_1, C_2) = 3\delta$$

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.
- The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:

$$u_1(A_1, B_2) + \delta u_1(C_1, C_2) = 3\delta$$

- Now suppose that player 1 deviates to  $C_1$  instead of playing  $A_1$

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.
- The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:

$$u_1(A_1, B_2) + \delta u_1(C_1, C_2) = 3\delta$$

- Now suppose that player 1 deviates to  $C_1$  instead of playing  $A_1$

- The worst the payoff that he could get in any SPNE:

$$u_2(C_1, B_2) + \delta u_2(A_1, A_2) = 5 + \delta$$

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.
- The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:

$$u_1(A_1, B_2) + \delta u_1(C_1, C_2) = 3\delta$$

- Now suppose that player 1 deviates to  $C_1$  instead of playing  $A_1$

- The worst the payoff that he could get in any SPNE:

$$u_2(C_1, B_2) + \delta u_2(A_1, A_2) = 5 + \delta$$

- $5 + \delta$  is always greater than  $3\delta$

Handwritten notes:  
 $3\delta > 5 + \delta$   
 $2\delta > 5$   
 $8 > 5$   
 no es posible  
 de jugar

- Now let us argue that  $(A_1, B_2)$  cannot be played in period 1 in a SPNE
- Suppose otherwise
- No matter what happens in the second period, there is no way  $A_1$  could be a best response against  $B_2$  in the first period.
- The maximum payoff that player 1 could get from playing according to this "supposed" SPNE:

$$u_1(A_1, B_2) + \delta u_1(C_1, C_2) = 3\delta$$

- Now suppose that player 1 deviates to  $C_1$  instead of playing  $A_1$

- The worst the payoff that he could get in any SPNE:

$$u_2(C_1, B_2) + \delta u_2(A_1, A_2) = 5 + \delta$$

- $5 + \delta$  is always greater than  $3\delta$

- By playing  $C_1$  against  $B_2$ , player 1 can guarantee a higher payoff

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?  
 The answer is no for the same reason

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?  
 The answer is no for the same reason  
 By playing  $A_1$  against  $C_2$ , the best that player 1 can hope for in a SPNE is:  

$$u_1(A_1, C_2) + \delta u_1(C_2, C_2) = 3\delta$$

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?  
 The answer is no for the same reason  
 By playing  $A_1$  against  $C_2$ , the best that player 1 can hope for in a SPNE is:  

$$u_1(A_1, C_2) + \delta u_1(C_2, C_2) = 3\delta$$
  
 The worst payoff that player 1 can obtain by playing  $C_1$  instead in period 1 is:  

$$u_1(C_1, C_2) + \delta u_1(A_2, A_2) = 3 + \delta$$

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?  
 The answer is no for the same reason  
 By playing  $A_1$  against  $C_2$ , the best that player 1 can hope for in a SPNE is:  

$$u_1(A_1, C_2) + \delta u_1(C_2, C_2) = 3\delta$$
  
 The worst payoff that player 1 can obtain by playing  $C_1$  instead in period 1 is:  

$$u_1(C_1, C_2) + \delta u_1(A_2, A_2) = 3 + \delta$$
  
 $3 + \delta$  is always greater than  $3\delta$

Can there be a SPNE in which  $(A_1, C_2)$  is played in period 1?  
 The answer is no for the same reason  
 By playing  $A_1$  against  $C_2$ , the best that player 1 can hope for in a SPNE is:  

$$u_1(A_1, C_2) + \delta u_1(C_2, C_2) = 3\delta$$
  
 The worst payoff that player 1 can obtain by playing  $C_1$  instead in period 1 is:  

$$u_1(C_1, C_2) + \delta u_1(A_2, A_2) = 3 + \delta$$
  
 $3 + \delta$  is always greater than  $3\delta$   
 Thus, there are incentives to deviate

$3\delta > 3 + \delta$   
 $2\delta > 3$   
 $\delta > 3/2$  No ES possible!

Symmetrically there cannot be any SPNE in which  $(B_1, A_2)$  and  $(C_1, A_2)$  are played in period 1

Symmetrically there cannot be any SPNE in which  $(B_1, A_2)$  and  $(C_1, A_2)$  are played in period 1  
 We already know that  $(A_1, A_2), (B_1, B_2), (C_1, C_2)$  can be played in a SPNE in period 1

Symmetrically there cannot be any SPNE in which  $(B_1, A_2)$  and  $(C_1, A_2)$  are played in period 1  
 We already know that  $(A_1, A_2), (B_1, B_2), (C_1, C_2)$  can be played in a SPNE in period 1  
 The remaining question is whether  $(C_1, B_2)$  can be played in period 1

Consider the following strategy profile:  
 Player 1's strategy is:  
 1. Play  $C_1$  in period 1  
 2. Play  $C_2$  in period 2 if the first period action profile was  $(C_1, C_1)$   
 3. Play  $C_1$  in period 2 if the first period action profile was anything other than  $(C_1, C_1)$   
 Player 2's strategy is:  
 1. Play  $C_2$  in period 1  
 2. Play  $C_1$  in period 2 if the first period action profile was  $(C_1, C_1)$   
 3. Play  $B_2$  in period 2 if the first period action profile was anything other than  $(C_1, C_1)$

$$u_1(C_1, B_2) + \delta u_1(C_1, C_2) \geq u_1(A_1, B_2) + \delta u_1(C_1, C_2)$$
  

$$u_1(C_1, B_2) + \delta u_1(C_1, C_2) \geq u_1(C_1, A_2) + \delta u_1(C_1, C_2)$$

- Player 1's strategy is:
  - Play  $A_1$  in period 1
  - Play  $C_1$  in period 2 if the first period action profile was  $(C_1, C_1)$
  - Play  $B_1$  in period 2 if the first period action profile was anything other than  $(C_1, C_1)$

- Player 2's strategy is:
  - Play  $C_2$  in period 1
  - Play  $B_2$  in period 2 if the first period action profile was  $(C_1, C_1)$
  - Play  $A_2$  in period 2 if the first period action profile was anything other than  $(C_1, C_1)$

$\delta < 1$

$$U_2(C_1, B_2) + \delta U_2(C_1, C_2) \geq \begin{cases} U_2(C_1, A_2) + \delta U_2(C_1, C_2) \\ U_2(C_1, C_2) + \delta U_2(A_1, A_2) \end{cases}$$

$$\underline{1} + \underline{\delta} \geq \begin{cases} 0 + \delta \\ 3 + \delta \end{cases}$$

$$1 + 3\delta \geq 3 + \delta$$

$$\delta \geq 1 \rightarrow \delta = 1$$

We know that the strategy is a NE in the subgames that start in  $t = 2$

We know that the strategy is a NE in the subgames that start in  $t = 2$

But what about the whole game?

So we can simplify the game which gives the following game tree.

The normal form of this game (conditional on what happens in  $T = 2$ ) is:

		Normal Form		
		$A_2$	$B_2$	$C_2$
$A_1$	$1 + 3\delta, 1 + 3\delta$	$3\delta, 3\delta$	$3\delta, 3\delta$	
$B_1$	$3\delta, 3\delta$	$4 + 3\delta, 4 + 3\delta$	$1 + 3\delta, 5 + 3\delta$	
$C_1$	$3\delta, 3\delta$	$5 + 3\delta, 1 + 3\delta$	$3 + \delta, 3 + \delta$	

In this game the best response for player  $i$  is:

$$BR_i(s_{-i}) = \begin{cases} A_1 & \text{if } s_2 = A_2 \\ C_1 & \text{if } s_2 = B_2 \\ C_1 & \text{if } s_2 = C_2 \\ B_1 & \text{if } s_2 = C_2 \text{ \& } \delta = 1 \end{cases}$$

In this game the best response for player  $i$  is:

$$BR_i(s_{-i}) = \begin{cases} A_1 & \text{if } s_2 = A_2 \\ C_1 & \text{if } s_2 = B_2 \\ C_1 & \text{if } s_2 = C_2 \\ B_1 & \text{if } s_2 = C_2 \text{ \& } \delta = 1 \end{cases}$$

In this game the best response for player 2 is:

$$BR_2(s_1) = \begin{cases} A_2 & \text{if } s_1 = A_1 \\ C_2 & \text{if } s_1 = B_1 \\ C_2 & \text{if } s_1 = C_1 \\ B_2 & \text{if } s_1 = C_1 \text{ \& } \delta = 1 \end{cases}$$

In this game the best response for player  $i$  is:

$$BR_i(s_{-i}) = \begin{cases} A_1 & \text{if } s_2 = A_2 \\ C_1 & \text{if } s_2 = B_2 \\ C_1 & \text{if } s_2 = C_2 \\ B_1 & \text{if } s_2 = C_2 \text{ \& } \delta = 1 \end{cases}$$

In this game the best response for player 2 is:

$$BR_2(s_1) = \begin{cases} A_2 & \text{if } s_1 = A_1 \\ C_2 & \text{if } s_1 = B_1 \\ C_2 & \text{if } s_1 = C_1 \\ B_2 & \text{if } s_1 = C_1 \text{ \& } \delta = 1 \end{cases}$$

An equilibrium outcome of this game is to play  $(C_1, B_2)$  in period 1 and  $(C_1, C_2)$  in period 2 if  $\delta = 1$

There are other SPNE that results in the same equilibrium outcome

For example consider the following SPNE

- Player 1's strategy is:
  - Play  $C_1$  in period 1
  - Play  $A_1$  in period 2 if the first period action profile was anything other than  $(C_1, B_2)$
  - Play  $B_1$  in period 2 if the first period action profile was  $(C_1, B_2)$

- Player 2's strategy is:
  - Play  $B_2$  in period 1
  - Play  $A_2$  in period 2 if the first period action profile was anything other than  $(C_1, B_2)$
  - Play  $C_2$  in period 2 if the first period action profile was  $(C_1, B_2)$

We know that the strategy is a NE in the subgames that start in  $t = 2$

$\delta < 1$

$$U_1(C_1, B_2) + \delta U_1(C_1, C_2) \geq \begin{cases} U_1(A_1, B_2) + \delta U_1(A_1, C_2) \\ U_1(B_1, B_2) + \delta U_1(B_1, C_2) \end{cases}$$

$$5 + 3\delta \geq \begin{cases} 0 + \delta \\ 3 + \delta \end{cases}$$

$\delta < 1$

$$U_2(C_1, B_2) + \delta U_2(C_1, C_2) \geq \begin{cases} U_2(C_1, A_2) + \delta U_2(A_1, A_2) \\ U_2(C_1, C_2) + \delta U_2(A_1, A_2) \end{cases}$$

$$\underline{1} + \underline{3\delta} \geq \begin{cases} 0 + \delta \\ 3 + \delta \end{cases}$$

$$1 + 3\delta \geq 3 + \delta$$

$$\underline{4\delta \geq 2}$$

$$1 + 3\delta \geq 3 + \delta$$

$$\underline{2\delta \geq 2}$$

$$\underline{\delta \geq 1} \rightarrow \boxed{\delta = 1}$$

We know that the strategy is a NE in the subgames that start in  $t = 2$

But what about the whole game?

So we can simplify the game which gives the following game tree.

The normal form of this game (conditional on what happens in  $T = 2$ ) is:

Normal Form			
	A <sub>2</sub>	B <sub>2</sub>	C <sub>2</sub>
A <sub>1</sub>	$1 + \delta, 1 + \delta$	$\delta, \delta$	$\delta, \delta$
B <sub>1</sub>	$\delta, \delta$	$4 + \delta, 4 + \delta$	$1 + \delta, 5 + \delta$
C <sub>1</sub>	$\delta, \delta$	$5 + 3\delta, 1 + 3\delta$	$3 + \delta, 3 + \delta$

In this game the best response for player 1 is:

$$BR_1(s_2) = \begin{cases} A_1 & \text{if } s_2 = A_2 \\ C_1 & \text{if } s_2 = B_2 \\ C_1 & \text{if } s_2 = C_2 \end{cases}$$

In this game the best response for player 2 is:

$$BR_2(s_1) = \begin{cases} A_2 & \text{if } s_1 = A_1 \\ C_2 & \text{if } s_1 = B_1 \\ C_2 & \text{if } s_1 = C_1 \\ B_2 & \text{if } s_1 = C_1 \text{ \& } \delta = 1 \end{cases}$$

An equilibrium outcome of this game is to play  $(C_1, B_2)$  in period 1 and  $(C_1, C_2)$  in period 2 if  $\delta = 1$

There are many many pure strategy SPNE of this game!

There are many many pure strategy SPNE of this game!

The set of pure strategy SPNE can involve the play of non-stage game NE action profiles in period 1 (although in period 2, players must play stage game NE)

There are many many pure strategy SPNE of this game!

The set of pure strategy SPNE can involve the play of non-stage game NE action profiles in period 1 (although in period 2, players must play stage game NE)

We've already seen that there may be multiple SPNE that lead to the same equilibrium outcomes

There are many many pure strategy SPNE of this game!

The set of pure strategy SPNE can involve the play of non-stage game NE action profiles in period 1 (although in period 2, players must play stage game NE)

We've already seen that there may be multiple SPNE that lead to the same equilibrium outcomes

Thus, characterizing all pure strategy SPNE is extremely tedious

There are many many pure strategy SPNE of this game!

The set of pure strategy SPNE can involve the play of non-stage game NE action profiles in period 1 (although in period 2, players must play stage game NE)

We've already seen that there may be multiple SPNE that lead to the same equilibrium outcomes

Thus, characterizing all pure strategy SPNE is extremely tedious

So instead of calculating all possible SPNE, lets just calculate the set of all possible equilibrium outcomes

► We know that the following are possible equilibrium outcomes:

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50

► We know that the following are possible equilibrium outcomes:

1.  $(A_1, A_2), (A_1, A_3)$

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50

► We know that the following are possible equilibrium outcomes:

### Lecture 18: Rational Games

Step 1: Set Up

Step 2: Use Backward Induction

Example 1

Example 2

00:00:00 00:00:00

Consider the following normal form game:

	Player 2		
	$B_1$	$C_1$	
$A_2$	1, 1	0, 0	$EN = \begin{pmatrix} B_1, B_2 \\ C_1, C_2 \end{pmatrix}$
$B_2$	0, 0	1, 1	
$C_2$	0, 0	0, 0	

00:00:00 00:00:00

• The above game has two Nash equilibria:  $(B_1, B_2)$  and  $(C_1, C_2)$

00:00:00 00:00:00

• The above game has two Nash equilibria:  $(B_1, B_2)$  and  $(C_1, C_2)$

• How would these equilibria have appeared from an extensive form game?

00:00:00 00:00:00

• The above game has two Nash equilibria:  $(B_1, B_2)$  and  $(C_1, C_2)$

• For a given extensive form game, how would you find the Nash equilibria?

• If there are two Nash equilibria, how would you know which one is the best for the players?

00:00:00 00:00:00

Case 1:

- Suppose that  $(B_1, B_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

Navigation icons

Case 1:

- Suppose that  $(B_1, B_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 2 obtains a payoff of

$$10 + \delta$$

Navigation icons

Case 1:

- Suppose that  $(B_1, B_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 2 obtains a payoff of

$$10 + \delta$$

- By deviating to  $B_2$  in period 1, player 2 obtains at least:

$$11 + \delta$$

since in period 2 either  $(B_1, B_2)$  or  $(C_1, C_2)$  will be played in any SPNE

Navigation icons

Case 1:

- Suppose that  $(B_1, B_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 2 obtains a payoff of

$$10 + \delta$$

- By deviating to  $B_2$  in period 1, player 2 obtains at least:

$$11 + \delta$$

since in period 2 either  $(B_1, B_2)$  or  $(C_1, C_2)$  will be played in any SPNE

- Thus there are incentives to deviate

Navigation icons

Case 2:

- Suppose instead that  $(C_1, C_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

Navigation icons

Case 2:

- Suppose instead that  $(C_1, C_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 1 obtains a payoff of

$$10 + \delta$$

Navigation icons

Case 2:

- Suppose instead that  $(C_1, C_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 1 obtains a payoff of

$$10 + \delta$$

- By deviating to  $B_1$  in period 1, player 1 obtains at least  $11 + \delta$

$$11 + \delta$$

Navigation icons

Case 2:

- Suppose instead that  $(C_1, C_2)$  is played in period 2 after  $(A_1, A_2)$  in period 1

- Player 1 obtains a payoff of

$$10 + \delta$$

- By deviating to  $B_1$  in period 1, player 1 obtains at least  $11 + \delta$

- Thus there are incentives to deviate

Navigation icons

- Even though there are multiple NE in the stage game, it may still be impossible to achieve Pareto efficient action profiles in period 1

Navigation icons

- Low risk of disease in multiple (B) in the first party, it is not a dominant strategy. Subgame perfect in period 1.
- The high risk disease can be played against in the first party as a subgame.

10:00 - 10:15 AM

- Low risk of disease in multiple (B) in the first party, it is not a dominant strategy. Subgame perfect in period 1.
- The high risk disease can be played against in the first party as a subgame.
- The low risk of disease can be played against in the first party as a subgame.

10:15 - 10:30 AM

Lecture 18: Repeated Games

- Repeated Games
- Multiple NE's in the repeated game
- Example 1
- Example 2

10:30 - 10:45 AM

Lecture 18: Repeated Games

- Repeated Games
- Multiple NE's in the repeated game
- Example 1
- Example 2

10:45 - 11:00 AM

- The NE of the repeated game is not unique. NE's are (C, C) and (D, D) for players who play a mixture of strategies in the first period.

11:00 - 11:15 AM

- Example 1: A repeated game with two players. NE is (C, C) in the first period. In the second period, the players play a mixture of strategies.
- Consider the strategy profile (C, C) and suppose no one else is playing C.

Stage Game

	C	D
C	10, 10	0, 0
D	0, 0	10, 10

$EN(B_1, B_2)$   
 $(C_1, C_2)$

11:15 - 11:30 AM

- The NE of the repeated game is (C, C) and (D, D).

11:30 - 11:45 AM

- The NE of the repeated game is (C, C) and (D, D).

11:45 - 12:00 PM

- In the repeated game, there is a unique subgame perfect equilibrium in the first period.

12:00 - 12:15 PM

- Consider the repeated game with two players.
- The NE of the repeated game is (C, C) and (D, D).
- The NE of the repeated game is (C, C) and (D, D).

$\Delta EPS \geq \epsilon = 2$  ✓  
 $\frac{1}{T=1} \left[ 10 + 3\delta \right] \geq \frac{1}{T=1} \left[ 10 + 3\delta \right]$   
 $U_1(A_1, A_2) + \delta U_1(B_1, B_2) \geq U_1(B_1, A_2) + \delta U_1(C_1, C_2)$   
 $U_1(C_1, A_2) + \delta U_1(C_1, C_2) \geq U_1(A_1, A_2) + \delta U_1(B_1, B_2)$   
 $10 + 3\delta \geq 10 + 3\delta$

- Player 1 uses the following strategy:
  - 1. In period 1,  $(A_1, A_1)$  was played.
  - 2. In period 2 if  $(A_1, A_1)$  was played in period 1,  $(A_1, A_1)$  was played.
  - 3. In period 2 if  $(A_1, A_1)$  was not played in period 1,  $(A_1, A_1)$  was played.

- Player 2 uses the following strategy:
  - 1. In period 1,  $(A_1, A_1)$  was played.
  - 2. In period 2 if  $(A_1, A_1)$  was played in period 1,  $(C_1, C_2)$  was played.
  - 3. In period 2 if  $(A_1, A_1)$  was not played in period 1,  $(C_1, C_2)$  was played.

Is the above an SPNE?

Is the above an SPNE?

no (if  $\delta < \frac{1}{2}$ )!

- So how do we construct a SPNE with  $(A_1, A_2)$  played in period 1?

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

- So how do we construct a SPNE with  $(A_1, A_2)$  played in period 1?

- The key here is to notice that player 2 does not need to be punished in period 2 from breaking the agreement in period 1.

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

- So how do we construct a SPNE with  $(A_1, A_2)$  played in period 1?

- The key here is to notice that player 2 does not need to be punished in period 2 from breaking the agreement in period 1.

- This is because in period 1 player 2 is best responding **myopically** at  $(A_1, A_1)$  already.

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

- So how do we construct a SPNE with  $(A_1, A_2)$  played in period 1?

- The key here is to notice that player 2 does not need to be punished in period 2 from breaking the agreement in period 1.

- This is because in period 1 player 2 is best responding **myopically** at  $(A_1, A_1)$  already.

- In other words, need to be punished **only** if the player has a deviation that benefits him **myopically** or in the short term.

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

- Player 1 plays the following strategy:
  1.  $A_1$  in period 1;
  2.  $B_1$  in period 2 if player 1 played  $A_1$ ;
  3.  $C_1$  in period 2 if player 1 played  $B_1$  or  $C_1$ .

- Player 2 plays the following strategy:
  1.  $A_2$  in period 1;
  2.  $B_2$  in period 2 if player 1 played  $A_1$ ;
  3.  $C_2$  in period 2 if player 1 played  $B_1$  or  $C_1$ .

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

Stage Game

	$A_2$	$B_2$	$C_2$
$A_1$	(10, 10)	(0, 9)	(0, 9)
$B_1$	(11, -1)	(1, 1)	(0, 0)
$C_1$	(11, -2)	(0, 0)	(1, 3)

- Player 1:

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

Stage Game

	$A_2$	$B_2$	$C_2$
$A_1$	(10, 10)	(0, 9)	(0, 9)
$B_1$	(11, -1)	(1, 1)	(0, 0)
$C_1$	(11, -2)	(0, 0)	(1, 3)

- Player 1:

- If he follows:  $v_1 = 10 + 3\delta$

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

Stage Game

	$A_2$	$B_2$	$C_2$
$A_1$	(10, 10)	(0, 9)	(0, 9)
$B_1$	(11, -1)	(1, 1)	(0, 0)
$C_1$	(11, -2)	(0, 0)	(1, 3)

- Player 1:

- If he follows:  $v_1 = 10 + 3\delta$
- If he defects:  $v_1 = 11 + \delta$

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100

Stage Game

	$A_2$	$B_2$	$C_2$
$A_1$	(10, 10)	(0, 9)	(0, 9)
$B_1$	(11, -1)	(1, 1)	(0, 0)
$C_1$	(11, -2)	(0, 0)	(1, 3)

- Player 1:

- If he follows:  $v_1 = 10 + 3\delta$
- If he defects:  $v_1 = 11 + \delta$
- Follows if  $\delta \geq \frac{1}{2}$

1/10 / 1/20 / 1/30 / 1/40 / 1/50 / 1/60 / 1/70 / 1/80 / 1/90 / 1/100
