Lecture 5: General Equilibrium

Introducing production

General equilibrium with production

Examples

Lecture 5: General Equilibrium

Introducing production

General equilibrium with production

Examples

What about the producers in the economy? There are two cases.

1. There are no producers in the economy; this is what is called a pure exchange economy in which all available goods are those coming from endowments from consumers (to use it now)
2. There are producers who can produce commodities in the economy (today)

Each firm j is characterized by two characteristics:

1. A production function f^j for producing that good!

Handwritten notes: f^j → **PROD. FUNC.**, j → **FIRMA j**, f^j → **TECNOLOGIA**

The firm j has a production function of the form:

$$f^j(x^j) = Q^j(x_1^j, \dots, x_n^j)$$

Handwritten notes: x_i^j → **BIEN i**, x^j → **LOS INSUMOS i**, $f^j(x^j)$ → **USO LA FIRMA j PARA PRODUCIR Q^j**

The firm j has a production function of the form:

$$f_j(x^j) = f_j(x_1^j, x_2^j, \dots, x_L^j).$$

- ▶ x^j for firm j describes the vector of inputs that firm j uses in the production of good l (l)
- ▶ In other words, firm j uses x_i^j units of commodity i to produce commodity l

- ▶ Firms are owned by consumers in society
- ▶ We need to describe who owns which firm
- ▶ Ownership is taken as exogenous

PARAMETERS
PROBLEM

- ▶ Firms are owned by consumers in society
- ▶ We need to describe who owns which firm
- ▶ Ownership is taken as exogenous... a more realistic model might involve consumers choosing which firms to own
- ▶ θ_{ij} will represent the fraction of firm j that is owned by consumer i

- ▶ Firms are owned by consumers in society
- ▶ We need to describe who owns which firm
- ▶ Ownership is taken as exogenous... a more realistic model might involve consumers choosing which firms to own
- ▶ θ_{ij} will represent the fraction of firm j that is owned by consumer i
- ▶ For each firm j , $\theta_{ij} \in [0, 1]$

- ▶ Firms are owned by consumers in society
- ▶ We need to describe who owns which firm
- ▶ Ownership is taken as exogenous... a more realistic model might involve consumers choosing which firms to own
- ▶ θ_{ij} will represent the fraction of firm j that is owned by consumer i
- ▶ For each firm j , $\theta_{ij} \in [0, 1]$
- ▶ $\sum_{i=1}^I \theta_{ij} = \theta_{1j} + \theta_{2j} + \dots + \theta_{Ij} = 1$ ✓

Introducing production

General equilibrium with production

Examples

Lecture 5: General Equilibrium

Introducing production

General equilibrium with production

Examples

Definition: $(\{x^i, y^i\}, p, (p_1, \dots, p_L))$ is a competitive equilibrium if:

- For all producers $j = 1, 2, \dots, J$, $y^j = (y_1^j, \dots, y_L^j)$ solves:

$$y^j = \arg \max_{y^j} \{ p \cdot y^j - \sum_{i=1}^I p_i x_i^j \}$$

(GAINANCIA MÁXIMA)
- For all consumers $i = 1, 2, \dots, I$, $x^i = (x_1^i, \dots, x_L^i)$ solves:

$$x^i = \arg \max_{x^i} \{ u^i(x^i) \}$$

(UTILIDAD MÁXIMA)
- Market clearing: For each commodity $l = 1, 2, \dots, L$,

$$\sum_{i=1}^I x_l^i + \sum_{j=1}^J y_l^j = \sum_{i=1}^I z_l^i + \sum_{j=1}^J \bar{y}_l^j$$

(GABO LABORABLE DE NEGOCIOS)

→ Consumo AGENTES
→ Consumo FIRMAS
→ Como "sumas"

(EN EQ LAS FIRMAS ESTÁN MAXIMIZANDO SU UTILIDAD)

GAINANCIA MÁXIMA
UTILIDAD MÁXIMA
GABO LABORABLE DE NEGOCIOS

We have exactly the same basic properties as in the case of pure exchange economies

1. When utility functions are strictly monotone, and production functions are strictly increasing, prices of each commodity and prices of each input are strictly positive.

Walras' Law: Each consumer i spends all of his income whenever i maximizes utility

3. Walras' Law II: If the market clearing conditions hold for $l = 1, 2, \dots, L-1$ and $p_L > 0$ then it will also hold for market L as well

4. If $(\{x^i, y^i\}, p, (p_1, \dots, p_L))$ is a Walrasian equilibrium, and $\alpha_i > 0$, $(\{\alpha x^i, \alpha y^i\}, p, (p_1, \dots, p_L))$ is also a Walrasian equilibrium.

5. The first and the second welfare theorems hold

General equilibrium with production

Examples
Robinson Crusoe

1. Imagine the problem of Robinson Crusoe. Using alone in an island. He is the only producer and the only consumer.

ECON METHOD
IA -> PROD
IB -> CONSUMER

VS

PLANNING

Suppose that the consumer (Robinson) has a utility function:

$$u(x, L) = x^\alpha L^{1-\alpha}$$

where x are coconuts. There is one firm (Robinson) that can convert labor to coconuts

$$f(L) = \beta L$$

The endowment is $(0, L)$

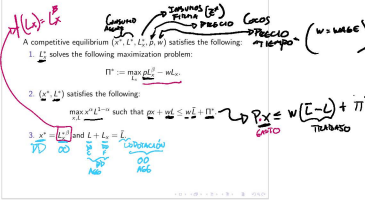

A competitive equilibrium (x^*, L^*, p, w) satisfies the following:

- x^* solves the following maximization problem:
$$\pi^* := \max_{x, L} p x - w L$$
- (L^*, L^*) satisfies the following:
$$\max_{x, L} x^\alpha L^{1-\alpha}$$
 such that $p x + w L \leq w L^* + \pi^*$
- $x^* = f(L^*)$ and $L^* + L^c = L_0$

$p_x = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)

$p_x = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)

$p_x > 0$ and $w = 0$ cannot happen (why?)

- $p_x = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)
- $p_x > 0$ and $w = 0$ cannot happen (why?)
- $p_x = 0$ and $w > 0$ cannot happen (why?)

- $p_x = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)
- $p_x > 0$ and $w = 0$ cannot happen (why?)
- $p_x = 0$ and $w > 0$ cannot happen (why?)
- both $p_x > 0$ and $w > 0$ is a competitive equilibrium. We can normalize $w=1$

(p, w) es un precio de EQ
 $(\frac{p}{w}, 1)$ TAMBIEN

The problem of the firm

- We first solve the profit maximization
- This is usually a good first step because the profit enters into the demand function
- We first solve the profit maximization

For any $(p, w=1)$ we want to solve:

$$\max_L pL^\alpha - L$$

$$\frac{\partial \Pi}{\partial L} - p\alpha L^{\alpha-1} - 1 = 0$$

$$L^{\alpha-1} = \frac{1}{p\alpha}$$

$$L^* = \left(\frac{1}{p\alpha}\right)^{\frac{1}{1-\alpha}} = (p\alpha)^{\frac{1}{1-\alpha}}$$

→ DEMANDA INVERSUNO

$f(L) = L^\alpha$
 $L^\alpha = \left(\frac{p}{p\alpha}\right)^{\frac{\alpha}{1-\alpha}}$ oferta (ocos)
 $\Pi^* = p\left(\frac{p}{p\alpha}\right)^{\frac{\alpha}{1-\alpha}} - \left(\frac{p}{p\alpha}\right)^{\frac{1}{1-\alpha}}$

The problem of the firm

- We first solve the profit maximization
- This is usually a good first step because the profit enters into the demand function
- We first solve the profit maximization

For any $(p, w=1)$, we want to solve:

$$\max_L pL^\alpha - L$$

First order conditions yield:

$$L^*(p) = (p\alpha)^{\frac{1}{1-\alpha}}$$

The problem of the firm

- We first solve the profit maximization
- This is usually a good first step because the profit enters into the demand function
- We first solve the profit maximization

For any $(p, w=1)$, we want to solve:

$$\max_L pL^\alpha - L$$

First order conditions yield:

$$L^*(p) = (p\alpha)^{\frac{1}{1-\alpha}}$$

Therefore,

$$\Pi^*(p) = p(p\alpha)^{\frac{\alpha}{1-\alpha}} - (p\alpha)^{\frac{1}{1-\alpha}} = p^{\frac{1}{1-\alpha}} (\alpha^{\frac{\alpha}{1-\alpha}} - \alpha^{\frac{1}{1-\alpha}})$$

The problem of the firm

- We first solve the profit maximization
- This is usually a good first step because the profit enters into the demand function
- We first solve the profit maximization

For any $(p, w=1)$, we want to solve:

$$\max_L pL^\alpha - L$$

First order conditions yield:

$$L^*(p) = (p\alpha)^{\frac{1}{1-\alpha}}$$

Therefore,

$$\Pi^*(p) = p(p\alpha)^{\frac{\alpha}{1-\alpha}} - (p\alpha)^{\frac{1}{1-\alpha}} = p^{\frac{1}{1-\alpha}} (\alpha^{\frac{\alpha}{1-\alpha}} - \alpha^{\frac{1}{1-\alpha}})$$

The supply of x is then given by:

$$x^*(p) = L^*(p)^\alpha = (p\alpha)^{\frac{\alpha}{1-\alpha}}$$

The problem of the consumer

To solve for the demand curve $x^*(p)$, $L^*(p)$, we solve:

$$\max_{x, L} x^{1-\alpha} L^\alpha \text{ such that } px + L \leq \pi + \Pi^*(p)$$

DEL PROB. DE LA FIRMA

$$y = x^{1-\alpha} L^\alpha + \lambda (\pi + \Pi^* - px - L)$$

$$\frac{\partial y}{\partial x} = (1-\alpha)x^{-\alpha} L^\alpha - \lambda p = 0 \Rightarrow \alpha x^{\alpha-1} L^\alpha = \lambda p$$

$$\frac{\partial y}{\partial L} = \alpha x^{1-\alpha} L^{\alpha-1} - \lambda = 0 \Rightarrow (\frac{1-\alpha}{\alpha}) x^\alpha L^{-\alpha} = \lambda$$

$$\frac{\partial L}{\partial X} = \alpha X^{\alpha-1} L^{-\alpha} - \lambda P = 0 \Rightarrow \alpha X^{\alpha-1} L^{-\alpha} = \lambda P$$

$$\frac{\partial L}{\partial L} = (1-\alpha) X^{\alpha} L^{-\alpha} - \lambda = 0 \Rightarrow (1-\alpha) X^{\alpha} L^{-\alpha} = \lambda$$

$$\frac{\frac{\alpha}{1-\alpha} \frac{L}{X} = P}{\frac{\alpha}{1-\alpha} \frac{L}{P} = X}$$

$$\bar{L} + \pi^* = PX + L$$

$$\bar{L} + \pi^* = P \left(\frac{\alpha}{1-\alpha} \frac{L}{P} \right) + L$$

$$\bar{L} + \pi^* = L \left(\frac{\alpha}{1-\alpha} + 1 \right)$$

$$\bar{L} + \pi^* = L \left(\frac{\alpha + 1 - \alpha}{1-\alpha} \right)$$

$$\bar{L} + \pi^* = L \left(\frac{1}{1-\alpha} \right)$$

$$\boxed{(1-\alpha)(\bar{L} + \pi^*) = L} \quad \text{DD OCIO}$$

$$\frac{\alpha}{1-\alpha} \frac{L}{P} = X$$

$$\left(\frac{\alpha}{1-\alpha} \right) \frac{1}{P} (1-\alpha)(\bar{L} + \pi^*) = X$$

$$\boxed{\frac{\alpha}{P} (\bar{L} + \pi^*) = X} \quad \text{DD COCOS}$$

3) MC DOS VACUEN.

COCOS: $\frac{\alpha}{P} (\bar{L} + \pi^*) = (PB)^{\frac{B}{1-B}}$

TIEMPO: $(1-\alpha)(\bar{L} + \pi^*) + (PB)^{\frac{1}{1-B}} = \bar{L}$

$$\alpha \bar{L} + \alpha \pi^* = P^{\frac{B}{1-B}} + 1 \cdot \beta^{\frac{B}{1-B}}$$

$$\alpha \bar{L} + \alpha \left(P^{\frac{1}{1-B}} \left(\frac{B}{P^{\frac{B}{1-B}}} - \frac{1}{\beta^{\frac{1}{1-B}}} \right) \right) = P^{\frac{B+1-B}{1-B}} \beta^{\frac{B}{1-B}}$$

The problem of the consumer
To solve for the demand curve $x^d(p)$, $L^d(p)$, we solve:
 $\max_{x,L} x^\alpha L^{1-\alpha}$ such that $px + L \leq \bar{L} + \pi^*(p)$.
By the first order condition, we get:
 $\frac{\alpha}{1-\alpha} \frac{L}{x} = p$.

The problem of the consumer
To solve for the demand curve $x^d(p)$, $L^d(p)$, we solve:
 $\max_{x,L} x^\alpha L^{1-\alpha}$ such that $px + L \leq \bar{L} + \pi^*(p)$.
By the first order condition, we get:
 $\frac{\alpha}{1-\alpha} \frac{L}{x} = p$.
Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} L + L = \bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right)$.

The problem of the consumer
To solve for the demand curve $x^d(p)$, $L^d(p)$, we solve:
 $\max_{x,L} x^\alpha L^{1-\alpha}$ such that $px + L \leq \bar{L} + \pi^*(p)$.
By the first order condition, we get:
 $\frac{\alpha}{1-\alpha} \frac{L}{x} = p$.
Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} L + L = \bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right)$.
Thus, $L^d(p) = (1-\alpha) \left(\bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right) \right)$.

The problem of the consumer
To solve for the demand curve $x^d(p)$, $L^d(p)$, we solve:
 $\max_{x,L} x^\alpha L^{1-\alpha}$ such that $px + L \leq \bar{L} + \pi^*(p)$.
By the first order condition, we get:
 $\frac{\alpha}{1-\alpha} \frac{L}{x} = p$.
Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} L + L = \bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right)$.
Thus, $L^d(p) = (1-\alpha) \left(\bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right) \right)$.
Then $x^d(p) = \frac{\alpha}{1-\alpha} \left(\bar{L} + \pi^*(p) \left(\beta^{\frac{B}{1-B}} - \beta^{\frac{1}{1-B}} \right) \right)$.

Market Clearing
We only need to check one market clearing condition (why?)

Market Clearing
We only need to check one market clearing condition (why?)
So let's check the market clearing condition for x :
 $x^d(p) = x^s(p)$.

Market Clearing
We only need to check one market clearing condition (why?)

$$\dots \left(\frac{1}{1-\beta} \right)^{-1} \quad \mu$$

$$\alpha \bar{L} = p^{\frac{1}{1-\beta}} \beta^{\frac{\beta}{1-\beta}} - \alpha p^{\frac{1}{1-\beta}} \left(\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}} \right)$$

$$\alpha \bar{L} = p^{\frac{1}{1-\beta}} \left(\beta^{\frac{\beta}{1-\beta}} - \alpha \left(\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}} \right) \right)$$

$$\frac{\alpha \bar{L}}{\beta^{\frac{\beta}{1-\beta}} - \alpha \left(\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}} \right)} = p^{\frac{1}{1-\beta}}$$

PRECIO EQ

$$\left(\frac{\alpha \bar{L}}{\beta^{\frac{\beta}{1-\beta}} - \alpha \left(\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}} \right)} \right)^{1-\beta} = p^*$$

Market Clearing
 We only need to check one market clearing condition (why?)
 So lets check the market clearing condition for x:
 $x^d(p) = x^s(p)$.
 As a result,
 $\frac{\alpha}{\beta} (\bar{L} + p^{\frac{1}{1-\beta}} (\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}})) = p^{\frac{1}{1-\beta}} \beta^{\frac{\beta}{1-\beta}}$.

Market Clearing
 We only need to check one market clearing condition (why?)
 So lets check the market clearing condition for x:
 $x^d(p) = x^s(p)$.
 As a result,
 $\frac{\alpha}{\beta} (\bar{L} + p^{\frac{1}{1-\beta}} (\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}})) = p^{\frac{1}{1-\beta}} \beta^{\frac{\beta}{1-\beta}}$.
 Solving this, we obtain:
 $p^* = \left(\frac{\alpha \bar{L}}{\alpha \beta^{\frac{\beta}{1-\beta}} + (1-\alpha) \beta^{\frac{1}{1-\beta}}} \right)^{1-\beta}$.

To solve for x^* , L^* , L^* , we plug the price back into the demand and supply functions.
 EQ
 Mercado
 $x^* = x^s(p^*) = \left(\frac{\beta^{\frac{\beta}{1-\beta}} \alpha \bar{L}}{\alpha \beta^{\frac{\beta}{1-\beta}} + (1-\alpha) \beta^{\frac{1}{1-\beta}}} \right)^{\beta}$ DD COCAS
 $L^* = \bar{L} - L_x^* = \frac{1-\alpha}{1-\alpha+\alpha\beta} \bar{L}$ DD COLO
 $L_x^* = L_x^s(p^*) = \frac{\alpha \bar{L}}{1-\alpha+\alpha\beta}$ DD TRABAJOS

To solve for x^* , L^* , L^* , we plug the price back into the demand and supply functions.
 $x^* = x^s(p^*) = \left(\frac{\beta^{\frac{\beta}{1-\beta}} \alpha \bar{L}}{\alpha \beta^{\frac{\beta}{1-\beta}} + (1-\alpha) \beta^{\frac{1}{1-\beta}}} \right)^{\beta}$
 $L^* = \bar{L} - L_x^* = \frac{1-\alpha}{1-\alpha+\alpha\beta} \bar{L}$
 $L_x^* = L_x^s(p^*) = \frac{\alpha \bar{L}}{1-\alpha+\alpha\beta}$
 We can also solve for the profits of the firm in equilibrium:
 $\Pi^*(p^*) = p^{*\frac{1}{1-\beta}} (\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}})$
 $= \frac{\alpha \bar{L}}{\alpha \beta^{\frac{\beta}{1-\beta}} + (1-\alpha) \beta^{\frac{1}{1-\beta}}} (\beta^{\frac{\beta}{1-\beta}} - \beta^{\frac{1}{1-\beta}})$.

What is the Pareto optimal allocation in this economy? Try it at home

⇒ PLANIFICADOR CENTRAL.

$$\max U = X^{\alpha} L^{1-\alpha} \quad \text{s.t.} \quad \begin{cases} X \leq L_x^{\beta} \\ L + L_x \leq \bar{L} \end{cases} \text{FACTIBLE.}$$

 ⇒ OPTIMO PARETO.

Lecture 5: General Equilibrium
 Introducing production
 General equilibrium with production
 Examples
 Robinson Crusoe
 Two Factor Model

Suppose that there is one consumer with a utility function
 $u(x, y) = x^{1/2} y^{1/2}$

There are two firms:
 $f_1(L_1, K_1) = L_1^{1/2} K_1^{1/2}$
 $f_2(L_2, K_2) = L_2^{1/2} K_2^{1/2}$

The endowments are given by $L = 1$, $\bar{K} = 1$, and 0 units of x and y .

What is a competitive equilibrium in this economy?

What is a competitive equilibrium in this economy? We must describe
 $(x^*, y^*, L_1^*, K_1^*, L_2^*, K_2^*, p_x, p_y, r, w)$

Handwritten: Mercado Capital, Mercado Trabajo = 0, Mercado Mercaderías

What is a competitive equilibrium in this economy? We must describe
 $(x^*, y^*, L_1^*, K_1^*, L_2^*, K_2^*, p_x, p_y, r, w)$

All equilibrium prices will be strictly positive in equilibrium, hence assume $p_x = 1$

$(\bar{p}_x, \bar{p}_y, \bar{r}, \bar{w})$
 $\frac{1}{\bar{p}_x} (\bar{p}_x, \bar{p}_y, \bar{r}, \bar{w})$
 $(\frac{1}{\bar{p}_x} \bar{p}_x, \frac{1}{\bar{p}_x} \bar{p}_y, \frac{1}{\bar{p}_x} \bar{r}, \frac{1}{\bar{p}_x} \bar{w})$

A competitive equilibrium must satisfy the following conditions:
 1. Profit maximization problem: (L_i^*, K_i^*) solves:
 $\Pi_i := \max_{L_i, K_i} f_i(L_i, K_i) - wL_i - rK_i$
 (L_i^*, K_i^*) solves:
 $\Pi_i = \max_{L_i, K_i} p_i f_i(L_i, K_i) - wL_i - rK_i$
 2. Utility maximization: (x^*, y^*) solves:
 $\max_{x, y} x^{\alpha} y^{1-\alpha}$ such that $x + p_x y \leq r\bar{K} + wL + \Pi_1 + \Pi_2$
 3. Markets clear:
 $L_1^* + L_2^* = L = 1$, $K_1^* + K_2^* = K = 1$, $x^* = 0$, $y^* = 0$

$f_x(L, K) = L^{1/2} K^{1/2}$
 $f_x(\lambda L, \lambda K) = \lambda^{1/2} L^{1/2} \lambda^{1/2} K^{1/2} = \lambda L^{1/2} K^{1/2} = \lambda f_x(L, K)$

$\Pi < 0 \Rightarrow$ Prod. infinito

$\Pi(L, K) = p f(L, K) - wL - rK$
 $\Pi(\lambda L, \lambda K) = p f(\lambda L, \lambda K) - w\lambda L - r\lambda K$
 $= p \lambda f(L, K) - \lambda wL - \lambda rK$
 $= \lambda (p f(L, K) - wL - rK)$
 $= \lambda \Pi(L, K)$

Handwritten: No puede ser en EQ.

$\Pi < 0 \rightarrow$ Prod. 0
 \Rightarrow Tampoco puede ser EQ

The problem of the firm
 We solve for profit maximization first (because Π_1 and Π_2 enter into the the consumer's problem)

The problem of the firm

- We solve for profit maximization first (because Π_x^* and Π_y^* enter into the the consumer's problem)
- Both firms make zero profits. Why?

$$\Pi_x = 0 = L_x^{1/2} K_x^{1/2} - wL_x - rK_x$$

$$\Pi_y = 0 = P_y L_y K_y^{1/2} - wL_y - rK_y$$

$\Rightarrow \Pi_x^* = 0$ EN $\Pi_y^* = 0$

The problem of the firm

- We solve for profit maximization first (because Π_x^* and Π_y^* enter into the the consumer's problem)
- Both firms make zero profits. Why?
 - This does not always happen (In the previous example, the firm made strictly positive profits)

The problem of the firm

- We solve for profit maximization first (because Π_x^* and Π_y^* enter into the the consumer's problem)
- Both firms make zero profits. Why?
 - This does not always happen (In the previous example, the firm made strictly positive profits)
 - This is because the production function here is of constant returns to scale

The problem of the firm

- We solve for profit maximization first (because Π_x^* and Π_y^* enter into the the consumer's problem)
- Both firms make zero profits. Why?
 - This does not always happen (In the previous example, the firm made strictly positive profits)
 - This is because the production function here is of constant returns to scale
 - If the firm made strictly positive profits, then it could not be making maximal profits since it could double profits by multiplying all inputs by two

The problem of the firm

We solve the profit maximization of the firm that produces x

The problem of the firm

We solve the profit maximization of the firm that produces x

For any $(p_x = 1, p_y, w, r)$ we want to solve:

$$\frac{\partial \Pi_x}{\partial L_x} = \frac{1}{2} \frac{K_x^{1/2}}{L_x^{1/2}} - w = 0$$

$$\frac{\partial \Pi_x}{\partial K_x} = \frac{1}{2} \frac{L_x^{1/2}}{K_x^{1/2}} - r = 0$$

$\Rightarrow \frac{1}{2} \frac{K_x^{1/2}}{L_x^{1/2}} = w$

$\Rightarrow \frac{K_x}{L_x} = \frac{w}{r}$

The problem of the firm

We solve the profit maximization of the firm that produces x

For any $(p_x = 1, p_y, w, r)$, we want to solve:

$$\max_{L, K} L^{1/2} K^{1/2} - Lxw - Kxr$$

First order conditions yield:

$$\frac{Kx}{Lx} = \frac{w}{r} \rightarrow Kx = \frac{w}{r} Lx$$

$$Lx^{1/2} Kx^{1/2} - Lxw - Kxr = 0$$

The problem of the firm

We solve the profit maximization of the firm that produces x

For any $(p_x = 1, p_y, w, r)$, we want to solve:

$$\max_{L, K} L^{1/2} K^{1/2} - Lxw - Kxr$$

First order conditions yield:

$$\frac{Kx}{Lx} = \frac{w}{r}$$

Therefore:

$$\left(\frac{w}{r}\right)^{1/2} Lx^{1/2} K^{1/2} - Lxw - Kxr = 0$$

$$\left(\frac{w}{r}\right)^{1/2} 2w = 0$$

$$\frac{1}{2} = w^{1/2} r^{1/2}$$

$$\frac{1}{4} = wr$$

The problem of the firm

We solve the profit maximization of the firm that produces y

$$\pi_y = p_y L_y^{1/2} K_y^{1/2} - wL_y - rK_y$$

$$\frac{\partial \pi_y}{\partial L_y} = p_y \frac{1}{2} \frac{K_y^{1/2}}{L_y^{1/2}} - w = 0$$

$$\frac{\partial \pi_y}{\partial K_y} = \frac{1}{2} p_y \frac{L_y^{1/2}}{K_y^{1/2}} - r = 0$$

The problem of the firm

We solve the profit maximization of the firm that produces y

$$\max_{L_y, K_y} p_y L_y^{1/2} K_y^{1/2} - L_y w - K_y r$$

The problem of the firm

We solve the profit maximization of the firm that produces y

$$\max_{L_y, K_y} p_y L_y^{1/2} K_y^{1/2} - L_y w - K_y r$$

First order conditions yield:

$$\frac{K_y}{L_y} = \frac{w}{r}$$

The problem of the firm

Therefore:

Handwritten notes:

$$K_x + K_y = 1$$

$$L_x + L_y = 1$$

$$\frac{K_y}{L_y} = \frac{w}{r}$$

$$1 = \frac{w}{r} \frac{L_y}{K_y}$$

$$r = w \frac{L_y}{K_y}$$

$$\frac{1}{2} = w = r$$

Handwritten derivations:

$$\left(\frac{w}{r}\right)^{1/2} Lx - Lxw - wLx = 0$$

$$Lx \left(\left(\frac{w}{r}\right)^{1/2} - 2w\right) = 0$$

$$\frac{w}{r} = 2w$$

$$1 = 2 \frac{w}{r}$$

$$1 = 2w^{1/2} r^{1/2}$$

$$\frac{1}{2} = w^{1/2} r^{1/2}$$

$$\frac{1}{4} = wr$$

$$\frac{K_x}{L_x} = \frac{w}{r}$$

$$\frac{K_y}{L_y} = \frac{w}{r}$$

$$K_y = L_y \frac{w}{r}$$

$$\frac{K_y}{L_y} = \frac{K_x}{L_x}$$

Handwritten derivations:

$$\pi_y = p_y K_y^{1/2} L_y^{1/2} - wL_y - rK_y = 0$$

$$= p_y K_y - wK_y - rK_y = 0$$

$$K_y = 1 = \frac{K_x}{L_x} = \frac{K_x}{K_x}$$

$$\Rightarrow K_y = L_x$$

$$p_y = w + r$$

$$p_y = \frac{1}{2} + \frac{1}{2} = 1$$

We also know that $p_y = 1$. Why?

The problem of the firm

- We cannot solve for the supply function because the firm obtains zero profit regardless of how much it produces
- But we already know the prices!

The problem of the consumer

max \sqrt{x} such that $x + y = 1$

The solution to this problem is $x = y = \frac{1}{2}$

market clearing

By market clearing we must have:

$$\frac{1}{2} = L_x^* = K_x^* = L_y^* = K_y^*$$

$\max_{x,y} x^{1/2} y^{1/2}$ s.t. $P_x \cdot X + P_y \cdot Y \leq w\bar{L} + r\bar{K} + \pi_x + \pi_y$
 $x + y \leq \frac{1}{2}(L) + \frac{1}{2}(L) = 1$

$J = x^{1/2} y^{1/2} + \lambda(1 - x - y)$
 $\frac{\partial J}{\partial x} = \frac{1}{2} \frac{y^{1/2}}{x^{1/2}} - \lambda = 0 \Rightarrow \frac{y}{x} = 1$
 $\frac{\partial J}{\partial y} = \frac{1}{2} \frac{x^{1/2}}{y^{1/2}} - \lambda = 0 \Rightarrow \frac{y}{x} = 1$

$1 = x + y$
 $\Rightarrow x = 1/2, y = 1/2$

X

$$\frac{1}{2} = K_x^{1/2} L_x^{1/2}$$

$$K_x = L_x$$

$$\frac{1}{2} = K_x^{1/2} K_x^{1/2} = K_x$$

$K_x^* = 1/2 = L_x^*$

Y

$$\frac{1}{2} = K_y^{1/2} L_y^{1/2}$$

$$\frac{1}{2} = K_y^{1/2} K_y^{1/2} = K_y$$

$\frac{1}{2} = K_y^* = L_y^*$

EQ

$x^* = \frac{1}{2}, y^* = \frac{1}{2}, K_x^* = \frac{1}{2}$
 $K_y^* = \frac{1}{2}, L_x^* = \frac{1}{2}, L_y^* = \frac{1}{2}$
 $P_x = 1, P_y = 1, w = \frac{1}{2}, r = 1/2$

OPTIMOS DE PARETO

$\max_{x,y,L_x,L_y,K_x,K_y} x^{1/2} y^{1/2}$ s.t.

$K_x + K_y = 1$
 $L_x + L_y = 1$
 $x = L_x^{1/2} K_x^{1/2}$
 $y = L_y^{1/2} K_y^{1/2}$

$x = L_x^{1/2} K_x^{1/2}$
 $y = (1 - L_x)^{1/2} (1 - K_x)^{1/2}$

$\max_{L_x, K_x} \underbrace{(L_x^{1/2} K_x^{1/2})}_x \underbrace{((1 - L_x)^{1/2} (1 - K_x)^{1/2})}_y = L_x^{1/4} K_x^{1/4} (1 - L_x)^{1/4} (1 - K_x)^{1/4}$
 $\dots \left(\frac{1}{4} L_x^{-3/4} K_x^{1/4} (1 - L_x)^{1/4} (1 - K_x)^{1/4} + \frac{1}{4} L_x^{1/4} K_x^{-3/4} (1 - L_x)^{1/4} (1 - K_x)^{1/4} \right) = 0$

$$\frac{\partial \ln \frac{Lx}{Lx, Kx}}{\partial Lx} = \frac{\left(\frac{Lx}{Kx} \right)^{-1/4} \left(\frac{1-Lx}{1-Lx} \right)^{-1/4}}{\left(\frac{Lx}{Kx} \right)^{-1/4} \left(\frac{1-Lx}{1-Lx} \right)^{-1/4}}$$

$$\frac{\partial}{\partial Lx} =$$

$$\frac{\partial}{\partial Lx} = \frac{1}{Kx^{1/4} (1-Kx)^{1/4}} \left(\frac{1}{4} Lx^{-3/4} (1-Lx)^{1/4} + Lx^{1/4} \frac{1}{4} (1-Lx)^{-3/4} (-1) \right) = 0$$

$$\frac{(1-Lx)^{1/4}}{Lx^{3/4}} - \frac{Lx^{1/4}}{(1-Lx)^{3/4}} = 0$$

$$\frac{(1-Lx)^{1/4}}{Lx^{3/4}} = \frac{Lx^{1/4}}{(1-Lx)^{3/4}}$$

$$1-Lx = Lx$$

$$Lx = 1/2$$

$$Lx = 1/2$$

$$Kx = 1/2$$

$$Kx = 1/2$$

$$\frac{\partial}{\partial Kx} \Rightarrow$$

$$x = 1/2 = Lx^{1/2} Kx^{1/2}$$

$$y = 1/2$$
