Beauty contest

- Consider the following game among 100 people. Each individual selects a number, s_i, between 20 and 60.
- Let a_{-i} be the average of the number selected by the other 99 people. i.e. $a_{-i} = \sum_{j \neq i} \frac{s_j}{99}$.
- The utility function of the individual i is $\boxed{u_i(s_i, s_{-i}) = 100 - (s_i - \frac{3}{2}a_{-i})^2}$

$$\frac{\partial U}{\partial S_i} = -2\left(S_i - \frac{3}{2}a_{-i}\right)(1) = 0$$

$$\boxed{S_i = \frac{3}{2}a_{-i}}$$

$S_{-i} \in [20, 60]$

$\downarrow$

$a_{-i} \in [20, 60]$

$\frac{3}{2}a_{-i} \in [30, 90]$

$S_i = 30$ DOMINA (ESTRICTAMENTE) a $S_i \in [20, 30)$

RONDA 2

$a_{-i} \in [30, 60]$

$\frac{3}{2}a_{-i} \in [45, 90]$

$S_i = 45$ DOMINA $S_i \in [30, 45)$

RONDA 3

$a_{-i} \in [45, 60]$

$\frac{3}{2}a_{-i} \in [67.5, 90]$

$S_i = 60$ DOMINA $S_i \in [45, 60)$

$$\Rightarrow (\underbrace{60, \ldots, 60}_{100 \text{ VECES}})$$

Beauty contest

- Each individual maximizes his utility, FOC:

$$-2(s_i - \frac{3}{2}a_{-i}) = 0$$

Beauty contest

- Each individual maximizes his utility, FOC:

$$-2(s_i - \frac{3}{2}a_{-i}) = 0$$

- Individuals would prefer to select a number that is exactly equal to 1.5 times the average of the others

---

Beauty contest

- Each individual maximizes his utility, FOC:

$$-2(s_i - \frac{3}{2}a_{-i}) = 0$$

- Individuals would prefer to select a number that is exactly equal to 1.5 times the average of the others
- That is they would like to choose $s_i = \frac{3}{2}a_{-i}$

Beauty contest

- Each individual maximizes his utility, FOC:

$$-2(s_i - \frac{3}{2}a_{-i}) = 0$$

- Individuals would prefer to select a number that is exactly equal to 1.5 times the average of the others
- That is they would like to choose $s_i = \frac{3}{2}a_{-i}$
- but $a_{-i} \in [20, 60]$

Beauty contest

- Each individual maximizes his utility, FOC:

$$-2(s_i - \frac{3}{2}a_{-i}) = 0$$

- Individuals would prefer to select a number that is exactly equal to 1.5 times the average of the others
- That is they would like to choose $s_i = \frac{3}{2}a_{-i}$
- but $a_{-i} \in [20, 60]$
- Therefore $s_i = 20$ is dominated by $s_i = 30$

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)
- Knowing this, all individuals believe that everyone else will select a number between 30 and 60 (i.e., $a_{-i} \in [30, 60]$)

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)
- Knowing this, all individuals believe that everyone else will select a number between 30 and 60 (i.e., $a_{-i} \in [30, 60]$)
- Playing a number between 30 and 45 (not including) would be strictly dominated by playing 45

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)
- Knowing this, all individuals believe that everyone else will select a number between 30 and 60 (i.e., $a_{-i} \in [30, 60]$)
- Playing a number between 30 and 45 (not including) would be strictly dominated by playing 45
- Knowing this, all individuals believe that everyone else will select a number between 45 and 60 (i.e., $a_{-i} \in [45, 60]$)

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)
- Knowing this, all individuals believe that everyone else will select a number between 30 and 60 (i.e., $a_{-i} \in [30, 60]$)
- Playing a number between 30 and 45 (not including) would be strictly dominated by playing 45
- Knowing this, all individuals believe that everyone else will select a number between 45 and 60 (i.e., $a_{-i} \in [45, 60]$)
- 60 would dominate any other selection and therefore all the players select 60.

Beauty contest

- The same goes for any number between 20 (inclusive) and 30 (not included)
- Knowing this, all individuals believe that everyone else will select a number between 30 and 60 (i.e., $a_{-i} \in [30, 60]$)
- Playing a number between 30 and 45 (not including) would be strictly dominated by playing 45
- Knowing this, all individuals believe that everyone else will select a number between 45 and 60 (i.e., $a_{-i} \in [45, 60]$)
- 60 would dominate any other selection and therefore all the players select 60.
- The solution by means of iterated elimination of dominated strategies is $\underbrace{(60, 60, ..., 60)}_{\text{100 times}}$

Lecture 12: Game Theory // Nash equilibrium

Dominance
  Weakly dominated strategies

Nash equilibrium

Some examples

Relationship to dominance

Examples
  Cournot Competition
  Cartels

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

$C \succeq A \downarrow b \succeq a \downarrow C \succ B \downarrow (C, b)$

$C \succeq B \downarrow a \succeq b \downarrow C \succ A \downarrow (C, a)$

- There is no strictly dominated strategy

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

- There is no strictly dominated strategy
- However, C always gives at least the same utility to player 1 as B

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

- There is no strictly dominated strategy
- However, C always gives at least the same utility to player 1 as B
- It's tempting to think player 1 would never play C

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

- There is no strictly dominated strategy
- However, C always gives at least the same utility to player 1 as B
- It's tempting to think player 1 would never play C
- However, if player 1 is sure that player two is going to play a he would be completely indifferent between playing B or C

Definition
s_i weakly dominates s_i' if for all opponent pure strategy profiles, $s_{-i} \in S_{-i}$,

$$u_i(s_i, s_{-i}) \geq u_i(s_i', s_{-i})$$

and there is at least one opponent strategy profile $s''_{-i} \in S_{-i}$ for which

$$u_i(s_i, s''_{-i}) > u_i(s_i', s''_{-i}).$$

- Given the assumptions we have, we can not eliminate a weakly dominated strategy

---

- Given the assumptions we have, we can not eliminate a weakly dominated strategy
- Rationality is not enough

- Given the assumptions we have, we can not eliminate a weakly dominated strategy
- Rationality is not enough
- Even so, it sounds "logical" to do so and has the potential to greatly simplify a game

---

- Given the assumptions we have, we can not eliminate a weakly dominated strategy
- Rationality is not enough
- Even so, it sounds "logical" to do so and has the potential to greatly simplify a game
- There is a problem, and that is that the order in which we eliminate the strategies matters

---

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

- If we eliminate B (C dominates weakly), then a weakly dominates b and we can eliminate b and therefore player 1 would never play A. This leads to the result (C, a).

---

	a	b
A	3, 4	4, 3
B	5, 3	3, 5
C	5, 3	4, 3

- If we eliminate B (C dominates weakly), then a weakly dominates b and we can eliminate b and therefore player 1 would never play A. This leads to the result (C, a).
- If on the other hand, we notice that A is also weakly dominated by C then we can eliminate it in the first round, and this would eliminate a in the second round and therefore B would be eliminated. This would result in (C, b).

Lecture 12: Game Theory // Nash equilibrium

Lecture 12: Game Theory // Nash equilibrium

Remember the definition of competitive equilibrium in a market economy.

Definition

A competitive equilibrium in a market economy is a vector of prices and baskets x_i such that: 1) x_i maximizes the utility of each individual given the price vector i.e.

$$x_i = \arg \max_{p \cdot x_i \leq p \cdot w_i} u(x_i)$$

2) the markets empty.

$$\sum_i x_i = \sum_i w_i$$

- 1) means that given the prices, individuals have no incentive to demand a different amount

---

- 1) means that given the prices, individuals have no incentive to demand a different amount
- The idea is to extend this concept to strategic situations

Best response

We denote $BR_i(s_{-i})$ (best response) as the set of strategies of individual i that maximize her utility given that other individuals follow the strategy profile s_{-i}. Formally,

---

Best response

We denote $BR_i(s_{-i})$ (best response) as the set of strategies of individual i that maximize her utility given that other individuals follow the strategy profile s_{-i}. Formally,

Definition

Given a strategy profile of opponents s_{-i}, we can define the best response of player i:

$$BR_i(s_{-i}) = \arg \max_{s_i' \in S_i} u_i(s_i', s_{-i}).$$

- $s_i \in BR_i(s_{-i})$ if and only if $u_i(s_i, s_{-i}) \geq u_i(s_i', s_{-i})$ for all $s_i' \in S_i$

Best response

We denote $BR_i(s_{-i})$ (best response) as the set of strategies of individual i that maximize her utility given that other individuals follow the strategy profile s_{-i}. Formally,

Definition

Given a strategy profile of opponents s_{-i}, we can define the best response of player i:

$$BR_i(s_{-i}) = \arg \max_{s_i' \in S_i} u_i(s_i', s_{-i}).$$

- $s_i \in BR_i(s_{-i})$ if and only if $u_i(s_i, s_{-i}) \geq u_i(s_i', s_{-i})$ for all $s_i' \in S_i$
- There could be multiple strategies in $BR_i(s_{-i})$ but all such strategies give the same utility to player i if the opponents are indeed playing according to s_{-i}

Nash equilibrium

Definition

Suppose that we have a game $(I = \{1, 2, \ldots n\}, S_1, \ldots, S_n, u_1, \ldots, u_n)$. Then a strategy profile $s^* = (s_1^*, \ldots, s_n^*)$ is a pure strategy **Nash equilibrium** if for every i and for every $s_i \in S_i$,

$$u_i(s_i^*, s_{-i}^*) \geq u_i(s_i, s_{-i}^*). \rightsquigarrow s_i^* \in BR_i(s_{-i}^*) \ \forall i$$

Nash equilibrium

Definition

Suppose that we have a game $(I = \{1, 2, \ldots, n\}, S_1, \ldots, S_n, u_1, \ldots, u_n)$. Then a strategy profile $s^* = (s_1^*, \ldots, s_n^*)$ is a **pure strategy** Nash equilibrium if for every i, $s_i^* \in BR_i(s_{-i}^*)$.

- Analogous to that of a competitive equilibrium in the sense that nobody has unilateral incentives to deviate

---

Nash equilibrium

Definition

Suppose that we have a game $(I = \{1, 2, \ldots, n\}, S_1, \ldots, S_n, u_1, \ldots, u_n)$. Then a strategy profile $s^* = (s_1^*, \ldots, s_n^*)$ is a **pure strategy** Nash equilibrium if for every i, $s_i^* \in BR_i(s_{-i}^*)$.

- Analogous to that of a competitive equilibrium in the sense that nobody has unilateral incentives to deviate
- once this equilibrium is reached, nobody has incentives to move from there

---

Nash equilibrium

Definition

Suppose that we have a game $(I = \{1, 2, \ldots, n\}, S_1, \ldots, S_n, u_1, \ldots, u_n)$. Then a strategy profile $s^* = (s_1^*, \ldots, s_n^*)$ is a **pure strategy** Nash equilibrium if for every i, $s_i^* \in BR_i(s_{-i}^*)$.

- Analogous to that of a competitive equilibrium in the sense that nobody has unilateral incentives to deviate
- once this equilibrium is reached, nobody has incentives to move from there
- This is a concept of stability, but there is no way to ensure, or predict, that the game will reach this equilibrium

Beauty contest

- Consider the following game among 2 people. Each individual selects a number, s_i, between 20 and 60.

Beauty contest

- Consider the following game among 2 people. Each individual selects a number, s_i, between 20 and 60.
- Let s_{-i} be the number selected by the other individual.

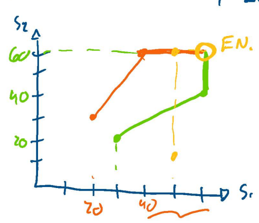
Beauty contest

- Consider the following game among 2 people. Each individual selects a number, s_i, between 20 and 60.
- Let s_{-i} be the number selected by the other individual.
- The utility function of the individual i is $u_i(s_i, s_{-i}) = 100 - (s_i - \frac{3}{2}s_{-i})^2$

$$\frac{\partial u_i(s_i, s_{-i})}{\partial s_i} \rightarrow 2(s_i - \tfrac{3}{2}s_{-i}) = 0$$

$$s_i = \tfrac{3}{2}s_{-i}$$

$$MR_i(s_{-i}) = \tfrac{3}{2}s_{-i} \longrightarrow MR_i(s_{-i}) = \begin{cases} \frac{3}{2}s_{-i} & \text{si } \frac{3}{2}s_{-i} \leq 60 \\ 60 & \text{si } \frac{3}{2}s_{-i} \geq 60 \end{cases}$$



$$MR_1(s_2) = \begin{cases} \frac{3}{2}s_2 & \text{si } s_2 \leq 40 \\ 60 & \text{si } s_2 \geq 40 \end{cases}$$

$$MR_2(s_1) = \begin{cases} \frac{3}{2}s_1 & \text{si } s_1 \leq 40 \\ 60 & \text{si } s_1 \geq 40 \end{cases}$$

Beauty contest

The best response of an individual is given by

$$s_i(s_{-i})^* = \begin{cases} \frac{3}{2}s_{-i} & \text{if } s_{-i} \leq 40 \\ 60 & \text{if } s_{-i} > 40 \end{cases}$$

The Nash equilibrium is where both BR functions intersect (i.e., when both play 60)

$$EN: (60, 60)$$

Prisoner's dilemma

	C	NC
C	5,5	0,10
NC	10,0	2,2

$$MR_1(s_2) = \begin{cases} NC & s_2 = C \\ NC & s_2 = NC \end{cases}$$

$MR_1(s_2) = NC$

$MR_2(s_1) = NC$

$EN = (NC, NC)$

Prisoner's dilemma

	C	NC
C	5,5	0,10
NC	10,0	2,2

The best response functions are:

$$BR_i(s_{-i}) = \begin{cases} NC & \text{if } s_{-i} = C \\ NC & \text{if } s_{-i} = NC \end{cases}$$

The Nash equilibrium is where both BR functions intersect (i.e., when both play NC, i.e., (NC, NC))

	C	NC
C	5,5	0,10
NC	10,0	2,2

Prisoner's dilemma – A trick

Best response of 1 to 2 playing C

	C	NC
C	5,5	0,10
NC	10,0	2,2

Prisoner's dilemma – A trick

Best response of 1 to 2 playing NC

	C	NC
C	5,5	0,10
NC	10,0	2,2

Prisoner's dilemma – A trick

Best response of 2 to 1 playing C

	C	NC
C	5,5	0,$\underline{10}$
NC	$\underline{10}$,0	2,2

Prisoner's dilemma – A trick

Best response of 2 to 1 playing NC

	C	NC
C	5,5	0,$\underline{10}$
NC	$\underline{10}$,0	$\underline{2}$,$\underline{2}$

When underlined for both players, it is a Nash equilibrium (both are doing their BR)

Battle of the sexes

s_2

s_1

	G	P
G	$\underline{2}$,$\underline{1}$	0,0
P	0,0	$\underline{1}$,$\underline{2}$

$EN = \{(G,G); (P,P)\}$

Battle of the sexes

	G	P
G	$\underline{2}$,$\underline{1}$	0,0
P	0,0	$\underline{1}$,$\underline{2}$

$$BR_i(s_{-i}) = \begin{cases} G & \text{if } s_{-i} = G \\ P & \text{if } s_{-i} = P \end{cases}$$

Battle of the sexes

	G	P
G	$\underline{2}$,$\underline{1}$	0,0
P	0,0	$\underline{1}$,$\underline{2}$

$$BR_i(s_{-i}) = \begin{cases} G & \text{if } s_{-i} = G \\ P & \text{if } s_{-i} = P \end{cases}$$

Thus, (G, G) y (P, P) are both Nash equilibrium

Nash equilibrium survive IDSDS

Theorem

Every Nash equilibrium survives the iterative elimination of strictly dominated strategies

Proof

By contradiction:

- Suppose it is not true

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*
- Without loss of generality say we eliminated the strategy s_i^* of individual i

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*
- Without loss of generality say we eliminated the strategy s_i^* of individual i
- It must have been that

$$u_i(s_i^*, s_{-i}) < u_i(s_i, s_{-i}) \forall s_{-i} \in S_{-i}$$

.

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*
- Without loss of generality say we eliminated the strategy s_i^* of individual i
- It must have been that

$$u_i(s_i^*, s_{-i}) < u_i(s_i, s_{-i}) \forall s_{-i} \in S_{-i}$$

.

- In particular

$$u_i(s_i^*, s_{-i}*) < u_i(s_i, s_{-i}^*)$$

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*
- Without loss of generality say we eliminated the strategy s_i^* of individual i
- It must have been that

$$u_i(s_i^*, s_{-i}) < u_i(s_i, s_{-i}) \forall s_{-i} \in S_{-i}$$

.

- In particular

$$u_i(s_i^*, s_{-i}*) < u_i(s_i, s_{-i}^*)$$

- But this means s_i^* is not the best response of individual i to s_{-i}^*

Proof

By contradiction:

- Suppose it is not true
- Then we must have eliminated some strategy in the Nash equilibrium s^*
- Lets zoom in in the round where we first eliminate a strategy that is part of s^*
- Without loss of generality say we eliminated the strategy s_i^* of individual i
- It must have been that

$$u_i(s_i^*, s_{-i}) < u_i(s_i, s_{-i}) \forall s_{-i} \in S_{-i}$$

.

- In particular

$$u_i(s_i^*, s_{-i}*) < u_i(s_i, s_{-i}^*)$$

- But this means s_i^* is not the best response of individual i to s_{-i}^*
- And this is a contradiction!

Nash equilibrium survive IDSDS

Theorem

If the process of IDSDS comes to a single solution, that solution is a Nash Equilibrium and is unique.

Proof

First let's proof its a Nash Equilibrium. The fact that is unique is trivial by the previous theorem.

Proof.
By contradiction:
- Suppose that the results from IDSDS (s^*) is not a Nash Equilibrium

□

Proof

Cournot Competition

- Are there any strictly dominant strategies? The answer is no, why?
- Are there any strictly dominated strategies?
- The strategies $q_i \in (120, +\infty)$ are strictly dominated by the strategy 0

Cournot Competition

- Are there any strictly dominant strategies? The answer is no, why?
- Are there any strictly dominated strategies?
- The strategies $q_i \in (120, +\infty)$ are strictly dominated by the strategy 0
- Are there any others? given q_{-i},

$$\frac{d\pi_i}{dq_i}(120 - q_i - q_{-i})q_i = 120 - 2q_i - q_{-i}$$

Cournot Competition

- Are there any strictly dominant strategies? The answer is no, why?
- Are there any strictly dominated strategies?
- The strategies $q_i \in (120, +\infty)$ are strictly dominated by the strategy 0
- Are there any others? given q_{-i},

$$\frac{d\pi_i}{dq_i}(120 - q_i - q_{-i})q_i = 120 - 2q_i - q_{-i}$$

- Therefore 60 strictly dominates any $q_i \in (60, 120]$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- for any $q_i \in [0, 60]$, there exists some $q_{-i} \in [0, +\infty)$ such that $BR_i(q_{-i}) = q_i$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- for any $q_i \in [0, 60]$, there exists some $q_{-i} \in [0, +\infty)$ such that $BR_i(q_{-i}) = q_i$
- Such a q_i can never be strictly dominated

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- for any $q_i \in [0, 60]$, there exists some $q_{-i} \in [0, +\infty)$ such that $BR_i(q_{-i}) = q_i$
- Such a q_i can never be strictly dominated
- After one round of deletion of strictly dominated strategies, we are left with: $S_i = [0, 60]$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- $q_{-i} = [0, 60]$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- $q_{-i} = [0, 60]$
- Therefore $q_i \in [0, 30)$ are strictly dominated by $q_i = 30$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- $q_{-i} = [0, 60]$
- Therefore $q_i \in [0, 30)$ are strictly dominated by $q_i = 30$
- After two rounds of deletion of strictly dominated strategies, we are left with: $S_i = [30, 60]$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- $q_{-i} = [30, 60]$
- 45 strictly dominates all strategies $q_i \in (45, 60]$
- After three rounds of deletion of strictly dominated strategies, we are left with: $S_i = [30, 45]$

Cournot Competition

- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- $q_{-i} = [30, 45]$
- 37.5 strictly dominates all strategies $q_i \in [30, 37.5]$
- After four rounds of deletion of strictly dominated strategies, we are left with: $S_i = [37.5, 45]$

Cournot Competition

- After (infinitely) many iterations, the only remaining strategies are $S_i = 40$
- The unique solution by IDSDS is $q_1^* = q_2^* = 40$.

Cournot Competition

- There will also be a unique Nash equilibrium

Cournot Competition

- There will also be a unique Nash equilibrium
- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$

Cournot Competition

- There will also be a unique Nash equilibrium
- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- At any Nash equilibrium, we must have: $q_1^* \in BR_1(q_2^*)$ and $q_2^* \in BR_2(q_1^*)$.

Cournot Competition

- There will also be a unique Nash equilibrium
- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- At any Nash equilibrium, we must have: $q_1^* \in BR_1(q_2^*)$ and $q_2^* \in BR_2(q_1^*)$.
- $$q_1^* = \frac{120 - q_2^*}{2}, q_2^* = \frac{120 - q_1^*}{2}.$$

Cournot Competition

- There will also be a unique Nash equilibrium
- $$BR_i(q_{-i}) = \frac{120 - q_{-i}}{2}.$$
- At any Nash equilibrium, we must have: $q_1^* \in BR_1(q_2^*)$ and $q_2^* \in BR_2(q_1^*)$.
- $$q_1^* = \frac{120 - q_2^*}{2}, q_2^* = \frac{120 - q_1^*}{2}.$$
- We can solve for q_1^* and q_2^* to obtain:
$$q_1^* = 40, q_2^* = 40, Q^* = 80, \Pi_1^* = \Pi_2^* = 1600.$$

$\Pi^m = (120 - Q)Q$

$\frac{\partial \Pi^m}{\partial Q} = 120 - 2Q = 0$

$Q^m = 60$

Cournot Competition vs Monopoly (cartel)

- In a perfectly competitive market, price equals marginal cost and the total quantity produced will be $Q = 120$.

Cournot Competition vs Monopoly (cartel)

- In a perfectly competitive market, price equals marginal cost and the total quantity produced will be $Q = 120$.
- A monopolist would solve the following maximization problem:
$$\max_Q (120 - Q)Q \Rightarrow Q^* = 60, P^* = 60, \Pi^m = 3600.$$

Cournot Competition vs Monopoly (cartel)

- In a perfectly competitive market, price equals marginal cost and the total quantity produced will be $Q = 120$.
- A monopolist would solve the following maximization problem:
$$\max_Q (120 - Q)Q \Rightarrow Q^* = 60, P^* = 60, \Pi^m = 3600.$$
- The profits to each firm in the Cournot Competition is less than half of the monopoly profits

Cournot Competition vs Monopoly (cartel)

- In a perfectly competitive market, price equals marginal cost and the total quantity produced will be $Q = 120$.
- A monopolist would solve the following maximization problem:
$$\max_Q (120 - Q)Q \Rightarrow Q^* = 60, P^* = 60, \Pi^m = 3600.$$
- The profits to each firm in the Cournot Competition is less than half of the monopoly profits
- In a duopoly, externalities are imposed on the other firm

Lecture 12: Game Theory // Nash equilibrium

Cartels

- Suppose there are three firms who face zero marginal cost
- The inverse demand function is given by:
$$p(q_1 + q_2 + q_3) = 1 - q_1 - q_2 - q_3 = 1 - Q$$

Cartels

- Suppose there are three firms who face zero marginal cost
- The inverse demand function is given by:

$$p(q_1 + q_2 + q_3) = 1 - q_1 - q_2 - q_3 = 1 - Q$$

- The first order condition gives

$$1 - 2q_i - Q_{-i} = 0 \Longrightarrow q_i = \frac{1 - Q_{-i}}{2} \Longrightarrow BR_i(Q_{-i}) = \frac{1 - Q_{-i}}{2}.$$

Cartels

- Suppose there are three firms who face zero marginal cost
- The inverse demand function is given by:

$$p(q_1 + q_2 + q_3) = 1 - q_1 - q_2 - q_3 = 1 - Q$$

- The first order condition gives

$$1 - 2q_i - Q_{-i} = 0 \Longrightarrow q_i = \frac{1 - Q_{-i}}{2} \Longrightarrow BR_i(Q_{-i}) = \frac{1 - Q_{-i}}{2}.$$

- In a Nash equilibrium we must have:

$$q_1^* = \frac{1 - q_2^* - q_3^*}{2}$$
$$q_2^* = \frac{1 - q_1^* - q_3^*}{2}$$
$$q_3^* = \frac{1 - q_1^* - q_2^*}{2}.$$

Cartels

- The easiest way to solve this first, let us add the three equations to get:

$$Q^* = \frac{3}{2} - Q^* \Longrightarrow Q^* = \frac{3}{4}.$$

Cartels

- The easiest way to solve this first, let us add the three equations to get:

$$Q^* = \frac{3}{2} - Q^* \Longrightarrow Q^* = \frac{3}{4}.$$

- Note that

$$q_1^* = \frac{1}{2} - \frac{q_2^* - q_3^*}{2} \Longrightarrow \frac{q_1^*}{2} = \frac{1}{2} - \frac{Q^*}{2} \Longrightarrow q_1^* = \frac{1}{4}.$$

Cartels

- The easiest way to solve this first, let us add the three equations to get:

$$Q^* = \frac{3}{2} - Q^* \Longrightarrow Q^* = \frac{3}{4}.$$

- Note that

$$q_1^* = \frac{1}{2} - \frac{q_2^* - q_3^*}{2} \Longrightarrow \frac{q_1^*}{2} = \frac{1}{2} - \frac{Q^*}{2} \Longrightarrow q_1^* = \frac{1}{4}.$$

- $q_1^* = q_2^* = q_3^* = \frac{1}{4}$

Cartels

- The easiest way to solve this first, let us add the three equations to get:

$$Q^* = \frac{3}{2} - Q^* \Longrightarrow Q^* = \frac{3}{4}.$$

- Note that

$$q_1^* = \frac{1}{2} - \frac{q_2^* - q_3^*}{2} \Longrightarrow \frac{q_1^*}{2} = \frac{1}{2} - \frac{Q^*}{2} \Longrightarrow q_1^* = \frac{1}{4}.$$

- $q_1^* = q_2^* = q_3^* = \frac{1}{4}$
- Price is $p^* = 1/4$ and all firms get the same profits of $1/16$

Cartels

- Two of the firms merge into firm A, while one of the firms remains single, call that firm B

Cartels

- Two of the firms merge into firm A, while one of the firms remains single, call that firm B
- Each firm then again faces the profit maximization problem:

$$\max_{q_i}(1 - q_i - q_{-i})q_i \Longrightarrow BR_i(q_{-i}) = \frac{1 - q_{-i}}{2}.$$

Cartels

- Two of the firms merge into firm A, while one of the firms remains single, call that firm B
- Each firm then again faces the profit maximization problem:

$$\max_{q_i}(1 - q_i - q_{-i})q_i \Longrightarrow BR_i(q_{-i}) = \frac{1 - q_{-i}}{2}.$$

- Therefore

$$q_A^* = \frac{1 - q_B^*}{2}$$
$$q_B^* = \frac{1 - q_A^*}{2}.$$

Cartels

- Solving this:

$$q_A^* = q_B^* = \frac{1}{3}.$$

Cartels

- Solving this:

$$q_A^* = q_B^* = \frac{1}{3}.$$

- The price is then $p^* = 1/3$

Cartels

- Solving this:

$$q_A^* = q_B^* = \frac{1}{3}.$$

- The price is then $p^* = 1/3$
- If the profits are shared equally among firms 1 and 2 who have merged, then profits of firms 1 and 2 are $1/18$ whereas firm 3 obtains a profit of $1/9$

Cartels

- Solving this:

$$q_A^* = q_B^* = \frac{1}{3}.$$

- The price is then $p^* = 1/3$
- If the profits are shared equally among firms 1 and 2 who have merged, then profits of firms 1 and 2 are $1/18$ whereas firm 3 obtains a profit of $1/9$
- Firms 1 and 2 suffered, while firm 3 is better off!

Cartels

- Solving this:

$$q_A^* = q_B^* = \frac{1}{3}.$$

- The price is then $p^* = 1/3$
- If the profits are shared equally among firms 1 and 2 who have merged, then profits of firms 1 and 2 are $1/18$ whereas firm 3 obtains a profit of $1/9$
- Firms 1 and 2 suffered, while firm 3 is better off!
- Firm 3 is obtaining a disproportionate share of the joint profits (more than $1/3$)

Cartels

- You might expect that 3 may want to join the cartel as well...

Cartels

- You might expect that 3 may want to join the cartel as well...
- In the monopolist problem, we solve:

$$\max_Q (1-Q)Q \Longrightarrow Q^* = \frac{1}{2}.$$

Cartels

- You might expect that 3 may want to join the cartel as well...
- In the monopolist problem, we solve:

$$\max_Q (1-Q)Q \Longrightarrow Q^* = \frac{1}{2}.$$

- Total profits then are given by $\frac{1}{4}$ which means that each firm obtains a profit of $\frac{1}{12} < \frac{1}{9}$

Cartels

- You might expect that 3 may want to join the cartel as well...
- In the monopolist problem, we solve:

$$\max_Q (1-Q)Q \Longrightarrow Q^* = \frac{1}{2}.$$

- Total profits then are given by $\frac{1}{4}$ which means that each firm obtains a profit of $\frac{1}{12} < \frac{1}{9}$
- Firm 3 clearly wants to stay out

Cartels

There are many difficulties associated with sustaining collusive agreements (e.g., the OPEC cartel)
