General equilibrium with production
Example

Lecture 5: General Equilibrium
Introducing production
General equilibrium with production
Example

What about the production in the economy? There are two cases:
1. There are no producers in the economy: this is what is called a pure exchange economy in which all available goods are those coming from endowments from consumers (up until now)
2. There are producers who can produce commodities in the economy (later)

Each firm j is characterized by two characteristics:
1. A production function f^j for producing that good i .

The firm j has a production function of the form:
$$f^j(x^j) = \beta_1 x_1^{\alpha_1} \beta_2 x_2^{\alpha_2} \dots \beta_n x_n^{\alpha_n}$$

The firm j has a production function of the form:
$$f^j(x^j) = \beta_1 x_1^{\alpha_1} \beta_2 x_2^{\alpha_2} \dots \beta_n x_n^{\alpha_n}$$

- x^j for firm j describes the vector of inputs that firm j uses in the production of good i
- In other words, firm j uses x^j units of commodity i in its production technology

- Firms are owned by consumers in society
- We need to describe who owns which firm
- Ownership is taken in aggregate - a firm's output might be used by consumers choosing which firms to own
- θ_j will represent the fraction of firm j that is owned by consumer i

- Firms are owned by consumers in society
- We need to describe who owns which firm
- Ownership is taken in aggregate - a firm's output might be used by consumers choosing which firms to own
- θ_j will represent the fraction of firm j that is owned by consumer i

- Firms are owned by consumers in society
- We need to describe who owns which firm
- Ownership is taken in aggregate - a firm's output might be used by consumers choosing which firms to own
- θ_j will represent the fraction of firm j that is owned by consumer i
- For each firm $j, \theta_j \in [0, 1]$

- Firms are owned by consumers in society
- We need to describe who owns which firm
- Ownership is taken in aggregate - a firm's output might be used by consumers choosing which firms to own
- θ_j will represent the fraction of firm j that is owned by consumer i
- For each firm $j, \theta_j \in [0, 1]$
- $\sum_{i=1}^I \theta_j = 1, \forall j = 1, \dots, J$

- Firms are owned by consumers in society
- We need to describe who owns which firm
- Ownership is taken in aggregate - a firm's output might be used by consumers choosing which firms to own
- θ_j will represent the fraction of firm j that is owned by consumer i
- For each firm $j, \theta_j \in [0, 1]$
- $\sum_{i=1}^I \theta_j = 1, \forall j = 1, \dots, J$
- No public enterprise here in that firms do not have any endowments

Lecture 5: General Equilibrium
Introducing production
General equilibrium with production
Example

Definition:
Let $(x^1, \dots, x^I, y^1, \dots, y^J)$ is a competitive equilibrium if:
1. For all problems $i=1, \dots, I$, $x^i = \arg \max_{x^i \in X^i} u^i(x^i)$ subject to $\sum_{i=1}^I x^i = \sum_{i=1}^I \omega^i$
2. For all consumers $i=1, \dots, I$, $x^i = \arg \max_{x^i \in X^i} u^i(x^i)$ subject to $\sum_{i=1}^I x^i = \sum_{i=1}^I \omega^i$
3. Markets clear for each commodity $i=1, \dots, I$:
$$\sum_{i=1}^I x^i + \sum_{j=1}^J y^j = \sum_{i=1}^I \omega^i + \sum_{j=1}^J \omega^j$$

We have exactly the same basic properties as in the case of pure exchange economies:
1. When the fraction of income is equally distributed, all production functions are strictly increasing, prices of each commodity and prices of each type are strictly positive.
2. Market Clear: Each consumer i spends all of his income whenever consumption utility.
3. Walras' Law: If the market clearing conditions hold for $i=1, \dots, I-1$, then it holds for $i=I$ as well.
4. If $(x^1, \dots, x^I, y^1, \dots, y^J)$ is a Walrasian equilibrium, and $\alpha > 0$, $(\alpha x^1, \dots, \alpha x^I, \alpha y^1, \dots, \alpha y^J)$ is also a Walrasian equilibrium.
5. The first and the second welfare theorems hold.

Introducing production
General equilibrium with production
Example
Robinson Crusoe

1. Imagine the problem of Robinson Crusoe living alone in an island. He is the only producer and the only consumer

Suppose that the consumer (John) has a utility function $u(x, y) = x^{\alpha} y^{1-\alpha}$ where α are constants. There is a producer (Thomas) that can convert labor into income $f(L) = \alpha L$. The endowment is $(\bar{L}, 0)$.

A competitive equilibrium (p, L^c, C^c, w) satisfies the following:
 1. L^c solves the following maximization problem:
 $\max_{L \in [0, \bar{L}]} \pi = \alpha p L^{\alpha} - wL$
 2. (C^c, Y^c) satisfies the following:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 3. $w = \alpha L^c$ and $L^c + L_p = \bar{L}$

$\pi = w(\bar{L} - L) + \pi^*$

$\alpha_p = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)

$\alpha_p = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)

$\alpha_p = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)

$\alpha_p = 0$ and $w = 0$ cannot happen in a competitive equilibrium (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)
 $\alpha_p = 0$ and $w = 0$ cannot happen (why?)
 Hypothesis 2 is a competitive equilibrium. We can continue with 1.

$\begin{pmatrix} P, W \\ P, L, Y \end{pmatrix} \rightarrow X \begin{pmatrix} L \\ Y \end{pmatrix}$

The problem of the firm:
 We first write the profit maximization:
 This is usually a good first step because the profit enters into the demand function.
 We then write the profit maximization for any $(p, w = 1)$, we want to solve:
 $\max_{L \in [0, \bar{L}]} \pi = \alpha p L^{\alpha} - L$
 First order conditions yield:
 $\pi'(L) = \alpha p L^{\alpha-1} - 1 = 0$

$\pi^* = p(\alpha p)^{\frac{1}{1-\alpha}} - (\alpha p)^{\frac{1}{1-\alpha}}$
 $X^{\text{firm}} = L^* = (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}}$

The problem of the firm:
 We first write the profit maximization:
 This is usually a good first step because the profit enters into the demand function.
 We then write the profit maximization for any $(p, w = 1)$, we want to solve:
 $\max_{L \in [0, \bar{L}]} \pi = \alpha p L^{\alpha} - L$
 First order conditions yield:
 $\pi'(L) = \alpha p L^{\alpha-1} - 1 = 0$

The problem of the firm:
 We first write the profit maximization:
 This is usually a good first step because the profit enters into the demand function.
 We then write the profit maximization for any $(p, w = 1)$, we want to solve:
 $\max_{L \in [0, \bar{L}]} \pi = \alpha p L^{\alpha} - L$
 First order conditions yield:
 $\pi'(L) = \alpha p L^{\alpha-1} - 1 = 0$
 Then:
 $\pi^*(p) = \alpha p (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}} - (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}}$

The problem of the firm:
 We first write the profit maximization:
 This is usually a good first step because the profit enters into the demand function.
 We then write the profit maximization for any $(p, w = 1)$, we want to solve:
 $\max_{L \in [0, \bar{L}]} \pi = \alpha p L^{\alpha} - L$
 First order conditions yield:
 $\pi'(L) = \alpha p L^{\alpha-1} - 1 = 0$
 Then:
 $\pi^*(p) = \alpha p (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}} - (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}}$
 The supply of x is then given by:
 $x^s(p) = \alpha p (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}}$

The problem of the consumer:
 To solve for the demand curve $x^d(p)$, $L^c(p)$, we solve:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 subject to $C + Y = \bar{L} + \pi^*$
 By the first order conditions, we get:
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow \frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C}$

$\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$

The problem of the consumer:
 To solve for the demand curve $x^d(p)$, $L^c(p)$, we solve:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 subject to $C + Y = \bar{L} + \pi^*$
 By the first order conditions, we get:
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} Y + Y = \bar{L} + \pi^* \Rightarrow Y = \frac{1-\alpha}{1-\alpha + \alpha} (\bar{L} + \pi^*) = (1-\alpha)(\bar{L} + \pi^*)$
 Then:
 $x^d(p) = \frac{\alpha}{1-\alpha} (1-\alpha)(\bar{L} + \pi^*) = \alpha(\bar{L} + \pi^*)$

$\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$

The problem of the consumer:
 To solve for the demand curve $x^d(p)$, $L^c(p)$, we solve:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 subject to $C + Y = \bar{L} + \pi^*$
 By the first order conditions, we get:
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} Y + Y = \bar{L} + \pi^* \Rightarrow Y = \frac{1-\alpha}{1-\alpha + \alpha} (\bar{L} + \pi^*) = (1-\alpha)(\bar{L} + \pi^*)$
 Then:
 $x^d(p) = \frac{\alpha}{1-\alpha} (1-\alpha)(\bar{L} + \pi^*) = \alpha(\bar{L} + \pi^*)$

$\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$

The problem of the consumer:
 To solve for the demand curve $x^d(p)$, $L^c(p)$, we solve:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 subject to $C + Y = \bar{L} + \pi^*$
 By the first order conditions, we get:
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} Y + Y = \bar{L} + \pi^* \Rightarrow Y = \frac{1-\alpha}{1-\alpha + \alpha} (\bar{L} + \pi^*) = (1-\alpha)(\bar{L} + \pi^*)$
 Then:
 $x^d(p) = \frac{\alpha}{1-\alpha} (1-\alpha)(\bar{L} + \pi^*) = \alpha(\bar{L} + \pi^*)$

$\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$

The problem of the consumer:
 To solve for the demand curve $x^d(p)$, $L^c(p)$, we solve:
 $\max_{C, Y} u(C, Y) = \alpha C^{\alpha} Y^{1-\alpha}$
 subject to $C + Y = \bar{L} + \pi^*$
 By the first order conditions, we get:
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 Substituting this back into the budget constraint, we get:
 $\frac{\alpha}{1-\alpha} Y + Y = \bar{L} + \pi^* \Rightarrow Y = \frac{1-\alpha}{1-\alpha + \alpha} (\bar{L} + \pi^*) = (1-\alpha)(\bar{L} + \pi^*)$
 Then:
 $x^d(p) = \frac{\alpha}{1-\alpha} (1-\alpha)(\bar{L} + \pi^*) = \alpha(\bar{L} + \pi^*)$

$\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$
 $\frac{C}{Y} = \frac{\alpha}{1-\alpha} \frac{Y}{C} \Rightarrow C = \frac{\alpha}{1-\alpha} Y$

Market Clearing:
 We only need to check one market clearing condition (why?)

Market Clearing:
 We only need to check one market clearing condition (why?)
 So let's check the market clearing condition for x :
 $x^s(p) = x^d(p)$

Market Clearing:
 We only need to check one market clearing condition (why?)
 So let's check the market clearing condition for x :
 $x^s(p) = x^d(p)$
 As a result:
 $\frac{\alpha}{1-\alpha} (\bar{L} + \pi^*(p)) = \alpha(\bar{L} + \pi^*(p))$

Market Clearing:
 We only need to check one market clearing condition (why?)
 So let's check the market clearing condition for x :
 $x^s(p) = x^d(p)$
 As a result:
 $\frac{\alpha}{1-\alpha} (\bar{L} + \pi^*(p)) = \alpha(\bar{L} + \pi^*(p))$
 Solving this, we obtain:
 $\frac{\alpha}{1-\alpha} (\bar{L} + \pi^*(p)) = \alpha(\bar{L} + \pi^*(p))$

To solve for $\pi^*(p)$, we plug the price back into the demand and supply functions:
 $\frac{\alpha}{1-\alpha} (\bar{L} + \pi^*(p)) = \alpha(\bar{L} + \pi^*(p))$

ASIGNACIONES E.G!

To solve for $\pi^*(p)$, we plug the price back into the demand and supply functions:
 $\frac{\alpha}{1-\alpha} (\bar{L} + \pi^*(p)) = \alpha(\bar{L} + \pi^*(p))$
 We can also verify for the profits of the firm in equilibrium:
 $\pi^*(p) = \alpha p (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}} - (\frac{\alpha p}{1-\alpha})^{\frac{1}{1-\alpha}}$

What is the Firm's optimal choice of inputs? Try to solve
 $\max_{L, K} x^{\alpha} L^{\beta} K^{\gamma}$ s.t. $L+K \leq \bar{L}$
 $x \leq f_x(L)$ } F.A.O.I.D.

Lecture 5: General Equilibrium
 General equilibrium with production
 Example
 Two Factor Model

Suppose that there is one consumer with a utility function
 $u(x, y) = x^{1/2} y^{1/2}$
 There are two firms
 $f_x(L_x, K_x) = L_x^{1/2} K_x^{1/2}$
 $f_y(L_y, K_y) = L_y^{1/2} K_y^{1/2}$
 The endowments are given by $L=1, K=1$ and 0 units of x and y

What is a competitive equilibrium in this economy? We must describe
 $(P, L_x^*, K_x^*, L_y^*, K_y^*, x^*, y^*, w, r)$

What is a competitive equilibrium in this economy? We must describe
 $(P, L_x^*, K_x^*, L_y^*, K_y^*, x^*, y^*, w, r)$

What is a competitive equilibrium in this economy? We must describe
 All equilibrium prices will be positive (positive in equilibrium, hence always > 0)

A competitive equilibrium must satisfy the following conditions:
 1. Profit maximization problem (Firm's problem) solves
 $\max_{L, K} P f(L, K) - wL - rK$
 (L_i, K_i) solves
 $\nabla_{L, K} (P f(L, K) - wL - rK) = 0$
 2. Utility maximization (Consumer's problem) solves
 $\max_{x, y} u(x, y)$ s.t. $x + y \leq \bar{x} + \bar{y}$
 3. Market clearing
 $x^* + y^* = \bar{x}$
 $L_x^* + L_y^* = \bar{L}$
 $K_x^* + K_y^* = \bar{K}$

$f_x = L^{1/2} K^{1/2}$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$f_x(L_x, K_x) = L_x^{1/2} K_x^{1/2}$
 $f_x(\lambda L_x, \lambda K_x) = \lambda^{1/2} L_x^{1/2} \lambda^{1/2} K_x^{1/2} = \lambda L_x^{1/2} K_x^{1/2} = \lambda f_x(L_x, K_x)$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem
 Both firms make zero profits. Why?

$\pi(L_x, K_x) = P f_x(L_x, K_x) - wL_x - rK_x$
 $\pi(\lambda L_x, \lambda K_x) = P \lambda f_x(L_x, K_x) - w \lambda L_x - r \lambda K_x = \lambda (P f_x(L_x, K_x) - wL_x - rK_x) = \lambda \pi(L_x, K_x)$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem
 Both firms make zero profits. Why?
 The market clearing constraint is the reason why the firm makes strictly positive profits

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem
 Both firms make zero profits. Why?
 The market clearing constraint is the reason why the firm makes strictly positive profits

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem
 Both firms make zero profits. Why?
 The market clearing constraint is the reason why the firm makes strictly positive profits

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$\frac{\partial \pi_x}{\partial L_x} = \frac{1}{2} L_x^{-1/2} K_x^{1/2} - w = 0 \Rightarrow \frac{L_x^{1/2} K_x^{1/2}}{L_x} = w$
 $\frac{\partial \pi_x}{\partial K_x} = \frac{1}{2} L_x^{1/2} K_x^{-1/2} - r = 0 \Rightarrow \frac{L_x^{1/2} K_x^{1/2}}{K_x} = r$
 $\frac{K_x}{L_x} = \frac{r}{w}$
 $\pi_x = 0 \Rightarrow P f_x - wL_x - rK_x = 0$
 $P f_x = wL_x + rK_x = L_x (w + r \frac{K_x}{L_x}) = L_x (w + r \frac{r}{w}) = L_x (\frac{w^2 + r^2}{w}) = 0$
 $w = 4w \Rightarrow \frac{w}{4} = w$
 $\frac{r}{4} = r$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$\pi_y = P_y L_y^{1/2} K_y^{1/2} - wL_y - rK_y$
 $\frac{\partial \pi_y}{\partial L_y} = P_y \frac{1}{2} L_y^{-1/2} K_y^{1/2} - w = 0$
 $\frac{\partial \pi_y}{\partial K_y} = P_y \frac{1}{2} L_y^{1/2} K_y^{-1/2} - r = 0$
 $\frac{L_y^{1/2} K_y^{1/2}}{L_y} = \frac{w}{P_y}$
 $\frac{L_y^{1/2} K_y^{1/2}}{K_y} = \frac{r}{P_y}$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$K_y = \frac{r}{w} L_y$
 $\frac{K_x}{L_x} = \frac{r}{w}$
 $\frac{K_y}{L_y} = \frac{r}{w}$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$\pi_y^* = 0 = P_y K_y^{1/2} L_y^{1/2} - wK_y - rL_y$
 $0 = P_y L_y^{1/2} (\frac{r}{w})^{1/2} L_y^{1/2} - wL_y - r(\frac{r}{w}) L_y$
 $0 = P_y L_y (\frac{r}{w})^{1/2} - 2wL_y = 0$
 $P_y (\frac{r}{w})^{1/2} = 2w$
 $P_y^2 = \frac{4w^2}{r} = 4w$
 $P_y^2 = 4w \frac{r}{4w} = r$
 $P_y = 1$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

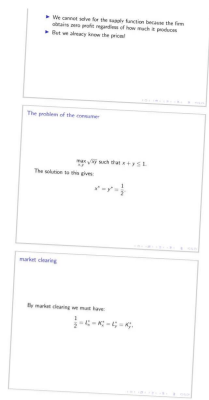

$\frac{K_x}{L_x} = \frac{r}{w}$
 $\frac{K_y}{L_y} = \frac{r}{w}$
 $\frac{K_x}{L_x} = \frac{K_y}{L_y}$
 $\frac{K_x L_y}{L_x K_y} = 1$
 $\frac{L_y}{L_x} = \frac{K_y}{K_x}$
 $\frac{L_y}{L_x} = \frac{r}{w} \frac{L_x}{K_x} = \frac{r}{w} \frac{L_x}{L_x \frac{r}{w}} = 1$

We also know that $P_x = 1$. Why?

$\frac{F_x}{L_x} = \frac{F_y}{L_y} \Rightarrow \frac{EN}{K_x + K_y} = \frac{EQ}{L_x + L_y} = \frac{K}{L}$

The problem of the firm
 We solve the profit maximization problem (Firm's problem) and insert into the consumer's problem

$\frac{K_x}{L_x} = \frac{K_y}{L_y} = \frac{K}{L}$
 $\frac{K_x}{L_x} = \frac{K - K_y}{L - L_y}$

$$\frac{K_x}{L_x} = \frac{\bar{K} - K_x}{L - L_x}$$

$$K_x \bar{L} - K_x L_x = \bar{K} L_x - L_x K_x$$

$$\frac{K_x}{L_x} = \frac{\bar{K}}{L} = 1 \Rightarrow K_x = L_x$$

$$\frac{w}{r} = \frac{K_x}{L_x} = 1 \Rightarrow w = r$$

$$\frac{1}{2} = w = r$$

$$\frac{1}{2} = w = r$$

② AGENTIC MAX

$$\text{MAX } x^{1/2} y^{1/2} \quad \text{s.t.} \quad P_x \cdot x + P_y \cdot y = \underbrace{\bar{L} \cdot \frac{1}{2}}_{1 \cdot \frac{1}{2}} + \underbrace{\bar{K} \cdot r}_{1 \cdot \frac{1}{2}} + \pi_x + \pi_y$$

$$\text{s.t.} \quad x + y = 1$$

$$y = x^{1/2} y^{1/2} + \lambda (x + y - 1)$$

$$\frac{\partial y}{\partial x} = \frac{1}{2} x^{-1/2} y^{1/2} + \lambda = 0$$

$$\frac{\partial y}{\partial y} = \frac{1}{2} x^{1/2} y^{-1/2} + \lambda = 0$$

$$\frac{y}{x} = 1 \Rightarrow y = x$$

$$\begin{aligned} x + y &= 1 \\ \Rightarrow x = 1/2, y = 1/2 \end{aligned}$$

$$EG = (x^e, y^e, K_x^e, L_x^e, K_y^e, L_y^e, w, r, P_x, P_y)$$

③ MC DOS VADLEN

$$x^e = f_x(K_x^e, L_x^e) = K_x^{1/2} L_x^{1/2} \rightarrow$$

$$\frac{1}{2} = K_x^{1/2} L_x^{1/2} = K_x^{1/2} K_x^{1/2} = K_x$$

$(L_x = 1/2)$

$$y^e = f_y(K_y, L_y) = K_y^{1/2} L_y^{1/2}$$

$$K_x + K_y = 1$$

$$L_x + L_y = 1$$

$$\begin{aligned} K_y &= 1/2 \\ L_y &= 1/2 \end{aligned}$$
