ABSTRACT

We examine the impact of progressive and regressive abortion legislation on women's health in Mexico. Following a 2007 reform in the Federal District of Mexico which decriminalised and subsidised early-term elective abortion, multiple other Mexican states increased sanctions on illegal abortion. We observe that the original legalisation resulted in a sharp decline in maternal morbidity, particularly morbidity due to haemorrhage early in pregnancy. We observe small or null impacts on women's health from increasing sanctions on illegal abortion. These results quantify the considerable improvements in non-mortal health outcomes flowing from legal access to abortion.

- After 2007 CDMX decriminalized and subsidized early-term elective abortion
- Use state-level variation over time resulting from legislative changes in abortion laws to identify their effect
- Data: Vital statistics data recording over 30 million births, 18.4 thousand maternal deaths and 46 million inpatient cases for causes related to maternal health

(e) Abortion-related Morbidity (Full sample, per 1000 women)

(f) Haemorrhage (Full sample, per 1000 women)

Estimating equation

$$\begin{aligned} \text{Health}_{st} = & \alpha_0 + \alpha_1 \text{ILE}_{st} + X'_{st} \Gamma_1 + \phi_s + \mu_t \\ & + (\phi_s \times \text{month}) + \varepsilon_{st} \end{aligned} \quad (1)$$

$$\begin{aligned} \text{Health}_{st} = & \beta_0 + \beta_1 \text{Regressive}_{st} + X'_{st} \Gamma_2 \\ & + \phi_s + \mu_t + (\phi_s \times \text{month}) + \eta_{st}. \end{aligned} \quad (2)$$

Will You Marry Me, Later? [↗](#)

Age-of-Marriage Laws and Child Marriage in Mexico

Cristina Bellés-Obrero
María Lombardi

ABSTRACT

We examine the impact of raising the minimum age of marriage to 18 years old in Mexico. Using a difference-in-differences model that takes advantage of the staggered adoption of this reform across states, we find a large reduction in the number of registered child marriages. However, we find no effect on school attendance or early fertility rates. We provide evidence that this is driven by a substitution of formal marriage for informal unions. This suggests that when informal unions are a viable option for young couples, age-of-marriage reforms are not enough to prevent early unions and their negative consequences.

- Between 2008 and 2018, most states in Mexico increased their minimum age of marriage
- Data: Granular data on marriages, births, and school attendance

POLITICAL COMPETITION AND STATE CAPACITY: EVIDENCE FROM A LAND ALLOCATION PROGRAM IN MEXICO*

Leopoldo Fergusson, Horacio Larreguy and Juan Felipe Riaño

We develop a model of the politics of state capacity building undertaken by incumbent parties that have a comparative advantage in clientelism rather than in public goods provision. The model predicts that, when challenged by opponents, clientelistic incumbents have the incentive to prevent investments in state capacity. We provide empirical support for the model's implications by studying policy decisions by the Institutional Revolutionary Party that affected local state capacity across Mexican municipalities and over time. Our difference-in-differences and instrumental variable identification strategies exploit a national shock that threatened the Mexican government's hegemony in the early 1960s.

- Exploits a national shock that threatened the Institutional Revolutionary Party's (PRI) hegemony in the early 1960s with varying intensity across municipalities
- To capture local bureaucratic capacity decisions by the PRI, look at a land allocation program that transferred property rights to communities in the form of ejidos
- Proximity to municipal headquarters was a central determinant of the cost of public good provision, and, consequently, of municipal bureaucratic state capacity.
- Data: Granular data on marriages, births, and school attendance

Estimating equation

$$\text{Distance}_{e,m,t} = \gamma \cdot (\text{Post1960}_{e,m,t} \times \text{Political Competition}_m) + \eta_m + \delta_t + \varepsilon_{e,m,t}, \quad (4)$$

Mexico

ABSTRACT

This paper estimates the effect of childcare availability on parents' employment probability using the timing of the grandmothers' death – the primary childcare provider in Mexico – as identifying variation. I use a triple-difference to disentangle the effect of cohabiting grandmothers' deaths due to their impact on childcare from their effects due to alternative mechanisms. Through their impact on childcare availability, grandmothers' deaths reduce mothers' employment rate by 12 percentage points (27 percent) and do not affect fathers' employment rate. The negative effect on mothers' employment is smaller where public daycare is more available, or private daycare or schools are more affordable.

- Natural experiment based on the plausibly exogenous timing of the death of coinhabiting grandmothers

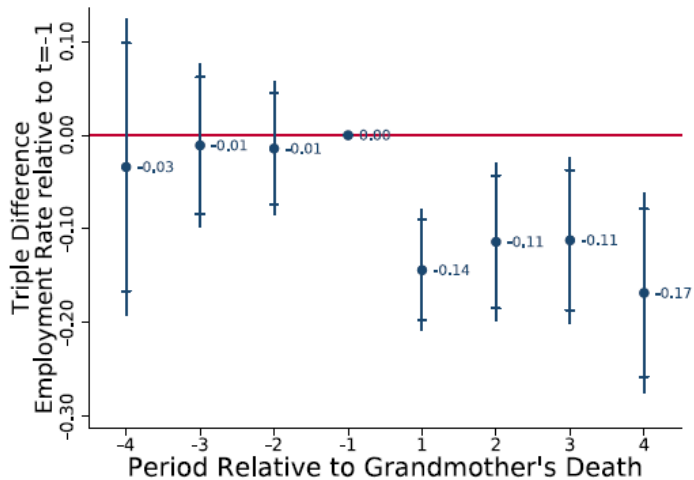

Estimating equation

$$\begin{aligned} \text{Employed}_{i,l,t} = & \beta_1 \text{Post}_{i,l,t} \times \text{Death}_{i,l}^{\text{GM}} + \beta_2 \text{Post}_{i,l,t} \\ & \times \text{Death}_{i,l}^{\text{GM}} \times \text{YoungChild}_{i,l} \\ & + \phi_i + \zeta_{l,t} + \gamma_{t,\text{YoungChild}} + \eta_{t,\text{DeathGM}} + \varepsilon_{i,l,t} \end{aligned} \quad (1)$$

Spatial Misallocation, Informality, and Transit Improvements: Evidence from Mexico City*

Román David Zárate[†]

World Bank

December 2022

Abstract

Developing countries have failed to enforce taxes across establishments leading to inefficiently high informality. Can transit infrastructure improve input allocation by reducing informality? This paper studies this question in Mexico City. I combine a rich collection of administrative microdata and exploit the construction of new subway lines. Transit improvements reduce informality by seven percent in areas near the new subway stations. I develop a spatial general equilibrium model that accounts for the direct effects of transit infrastructure in purely efficient economies and on allocative efficiency in economies with distortions. Changes in allocative efficiency driven by workers' reallocation to the formal sector amplify the gains by around 25%.

Keywords: Informality, allocative efficiency, urban transit infrastructure.

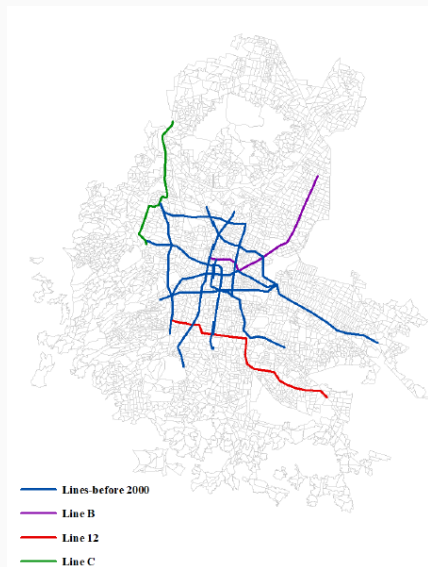

- Estimate the effect of transit improvements (Linea B) on workers' reallocation across the formal and informal sectors
- difference-in-differences specifications that use variation in access to new transit (census tracts close and far away from new line)

Full-time schools, policy-induced school switching, and academic performance[☆]

María Padilla-Romo

ABSTRACT

While many developing countries are extending their school day from half- to full-time, little is known about the effects of such programs on student outcomes. Mexico recently extended its school-day duration from 4.5 h to 8 h through a full-time schools program. Using administrative student-level panel data, I exploit variation in the rollout of this program to identify its effect on math and language test scores. Controlling for endogenous switching between schools, I find that full-time schooling improves students' math and language test scores, respectively, by 2.4 and 1.5 percent of a standard deviation in the first year of implementation. These results persist, growing to 13.7 and 10.8 percent of a standard deviation after five years. Moreover, the main results indicate that failure to control for endogenous school switching inflates the effects of five years of exposure to full-time schooling by a factor of 1.2 on math test scores and by a factor of 1.6 on language test scores.

- Many developing countries are extending their school day from half- to full-time
- Mexico full time schools: Started in 2007 and had reached more than 25,000 schools by 2018
- Extended school-day duration by 3.5 hours (4.5 to 8) and provided school lunch

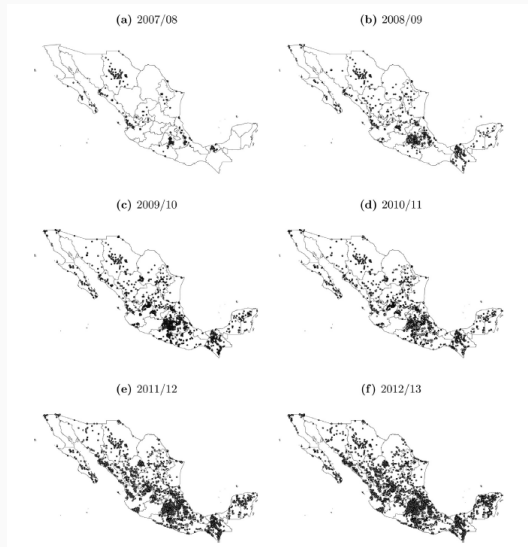

Table 1

Comparison of the time allocation between half-time and full-time schools.

Abstract

This paper compares the performance of teachers hired on the basis of a standardized exam to those hired at the union's discretion in Mexico. My results show that the discretionary hires perform considerably worse than the rule-based hires (as measured by value added to student achievement). The evidence presented here shows the impact of personnel selection mechanisms on the quality of public service delivery.

In a nutshell

- In Mexico, public school teachers enjoy high hourly wages and high job security
- Classroom observations: 50% of instructional time is lost in Mexico City's primary schools
- Until 2014, the national teachers' union (SNTE) had the leading voice in a highly discretionary process used to hire new teachers
- This process was controversial; widespread nepotism and the selling of jobs
- 2008 reform: national examination based on a standardized exam to fill some teaching positions
- 2013 Constitutional amendment: all vacant teaching positions in public schools to be filled through a national and competitive examination
- Compare the performance of teachers hired in the discretionary process with that of teachers hired based on test scores in the standardized exam

Abstract

We show that bureaucrats can exploit discretion in hiring decisions to engage in forms of favoritism that hinder organizational performance. We do this in the context of the Mexican federal judiciary. The arrival of a judge at a circuit results in the hiring of 0.05 relatives to key staff positions within the following year on average, a figure which is probably a lower bound of the overall effect. Moreover, we find that related appointees are negatively selected in terms of educational level and that their hiring leads to a reduction in the court's productivity, which indicates that such hires are motivated by rent-seeking rather than by efficiency purposes. Importantly

- The selection of federal judges is made through competitive examinations
- Judges, in turn, have leeway to appoint individuals to work in their courts, even in the most important positions such as that of judicial clerk
- Use data on the curricular information of judicial officials
- Event-study design to estimate whether the arrival of a judge at a circuit increases the prevalence of that judge's relatives (proxied by family names) among the staff of the corresponding judicial circuit.

Figure 1: Judge arrivals, by month

Estimating equation

$$Y_{ict} = \sum_{\tau=-7, \tau \neq -1}^{12} \beta_{\tau} \cdot \mathbb{1}[\tau = t - e_{ic}] + \theta_i + \lambda_t + \epsilon_{it} \quad (1)$$

The Long-Run Effects of Mexico's Telesecundarias*

Abstract

Every year over one million children in rural Mexico attend *telesecundarias*, lower secondary schools with classes transmitted through satellite television. *Telesecundarias* substitute on-site subject-specialized teachers with televised content, substantially reducing the costs of education delivery in remote locations. Using census data from 2010, this paper estimates the long-term educational and labor market outcomes of adolescents living in rural areas who were exposed to a telesecundaria expansion policy in the 1990s. I obtain causal estimates by exploiting geographical differences in the intensity of telesecundaria school openings and cohort exposure induced by the timing of the policy. As adults, exposed men and women are more likely to have completed primary and lower secondary education. The roll-out had positive effects on the labor force participation and earnings of men. While I do not find much evidence of labor market improvements for women, they appear to have benefited in other dimensions. Those exposed to the program are less likely to receive income from the government as adults.

In a nutshell

- Over one million children in rural Mexico attend telesecundarias, lower secondary schools with classes transmitted through satellite television
- Not an isolated program: A dozen low- and middle-income countries started using televisions in education between 1950 and 1970, and many more have implemented similar programs since then
- Take advantage of a telesecundaria expansion that took place between 1994 and 2000, following legislation that made lower secondary schooling mandatory
- Using census data from 2010, estimate impacts on measures of educational attainment, labor market outcomes, and living standards in adulthood

Estimating equation

$$y_{imc} = \alpha + (I_m \cdot d_c)\beta_1 + \mu_c + \theta_m + \gamma_s c + X_{cm}\delta + \epsilon_{imc}$$

Estimating equation

I also graphically show a multiple cohort difference-in-differences strategy, exploiting exposure to the expansion program by interacting the measure of telesecundaria intensity with multi-year cohort dummies. The coefficient of interest is an estimate of the impact of the expansion of telesecundarias for a given cohort group k . Cohorts are binned into groups to improve power and reduce noise. Those who were 16-18 years of age in 1994 are left as the comparison group (the omitted dummy). The equation is of the form:

$$y_{imsk} = \alpha + \sum_{k=1}^7 (I_m \cdot d_{ik}) \beta_{1k} + \mu_c + \theta_m + \gamma_s c + X_{cm} \delta + \epsilon_{imsk} \quad (2)$$

Cash for Coolers: Evaluating a Large-Scale Appliance Replacement Program in Mexico

By LUCAS W. DAVIS, ALAN FUCHS, AND PAUL GERTLER 

This paper evaluates a large-scale appliance replacement program in Mexico that from 2009 to 2012 helped 1.9 million households replace their old refrigerators and air conditioners with energy-efficient models. Using household-level billing records from the universe of Mexican residential customers, we find that refrigerator replacement reduces electricity consumption by 8 percent, about one-quarter of what was predicted by ex ante analyses. Moreover, we find that air conditioning replacement actually increases electricity consumption. Overall, we find that the program is an expensive way to reduce externalities from energy use, reducing carbon dioxide emissions at a program cost of over \$500 per ton. (JEL L68, L94, O12, O13, Q41, Q54)

- Appliance replacement program in Mexico that from 2009 to 2012 helped 1.9 million households replace their old refrigerators and air conditioners with energy efficient models

Estimating equation

$$y_{it} = \sum_{k=-12}^{12} \alpha_k 1[\tau_{it} = k]_{it} + \gamma_i + \omega_{ct} + \varepsilon_{it},$$
